

CABLOFIL STEEL WIRE CABLE TRAY PRODUCT TECHNICAL GUIDE

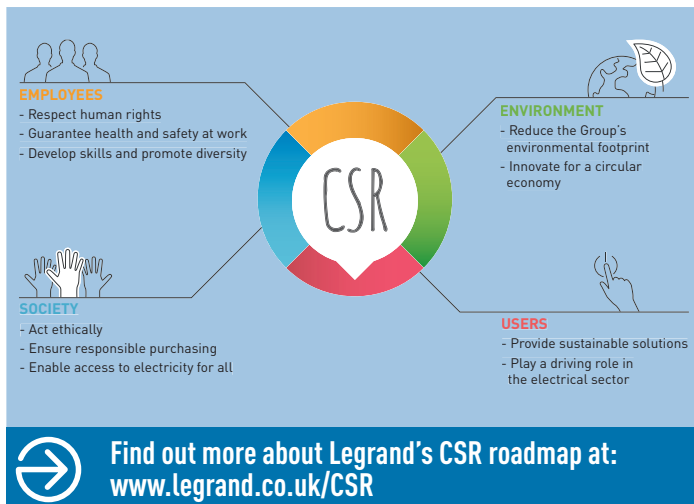

Global strength built on local knowledge

Legrand is the global specialist in electrical and digital building infrastructures. Innovation is the driving force behind its development. With an increasing investment in research and development (circa 5% of sales) and more than 4,000 active patents, the Legrand Group is focused on maintaining a high rate of new product launches that present innovative solutions to the market.

CORPORATE SOCIAL RESPONSIBILITY

Legrand's 2014-2018 CSR roadmap is a natural extension to the governance and sustainable development approach in which the company has been engaged for many years. The CSR roadmap firmly reasserts Legrand's commitment to sustainable development.

Legrand

the cable
management
expert

Complete cable management solutions

Using its global strength and market leading position, Legrand has developed a complete range of cable management solutions, including:

- **Swifts cable ladder**
- **Swifts cable tray**
- **Salamandre distribution trunking and lighting trunking**
- **Cablofil steel wire cable tray**
- **Floor systems**
- **Perimeter systems**

Specification data for engineering software systems

As part of its ongoing commitment to customer support, Legrand's cable management ranges have been integrated into a number of plant design modelling systems.

CABLOFIL STEEL
WIRE CABLE TRAY

Cablofil... trusted for installations large and small

Cablofil steel wire cable tray has been tried and tested in installations of all sizes throughout the UK and beyond, from light duty requirements in small commercial buildings through to extra heavy duty installations in refineries and heavy industry applications such as shipbuilding.

One team. One product portfolio... endless possibilities

As part of Legrand UK's cable management business unit, Cablofil products and systems are supported by a team of experts who live and breathe cable management.

With in-depth knowledge, a vast combined level of experience and a complete cable management product offering at their disposal, our team is able to provide customers with support and advice at any stage of their project, from design through to installation and beyond.

Legrand's market leading Cablofil steel wire cable tray provides a robust, versatile cable management solution for installations of almost any size

- Fast, simple installation
- Easily reconfigured
- Slot and tab boltless system

Designed to be easy to install and configure on site, Cablofil is the UK market leader in steel wire cable tray... an established and popular choice in cable management installations.

CABLOFIL...

the leader in steel wire cable tray

Fast, simple, reliable installations

Cablofil steel wire cable tray is supplied in straight lengths from which sophisticated installations can be created without the need for additional fittings.

Simply cut and shape lengths to form bends, tees, crosspieces etc and secure quickly and easily using a range of 'slot and tab' fixings that do not require nuts and bolts.

- Vast range of supports for wall, ceiling and floor mounting
- Save on installation time with Cablofil's fast fix brackets
- Eradicate the need for nuts and bolts with Cablofil's 'slot and tab' boltless system
- Straight lengths available with pre-fitted couplers for rapid connection
- Natural ventilation provides greater cable efficiency
- Available in several finishes to suit different installation requirements

INNOVATIONS

for easy installations

Fasclic Auto...

The new Fasclic Auto range of 54 mm deep steel wire cable tray is supplied complete with pre-fitted couplers for quick and easy connection of straight lengths. Lengths simply clip together without the need for additional fasteners.

Faslock Auto...

The simple answer to fabricating fittings on site. Create radius bends and reducers in minutes with Faslock Auto. No additional fasteners (or fuss) required.

Specialist solutions

EZ+... increased life expectancy in demanding environments

Potentially corrosive environments such as tunnels, airports and energy production facilities call for tough products that can stand the test of time. Cablofil's latest innovation in surface treatment, EZ+, has been proven to live up to the challenge.

EZ+ is an additional organic finish applied over standard electrozinc plated steel wire cable trays, offering a durable surface treatment for temporary external installations during the construction phase.

In addition to Cablofil's unique rounded wires and T-welded safety edges, the EZ+ coating provides a smooth, consistent surface which further reduces the risk of damage to both the cables and the installer.

EZ-Path[®] ...

EZ-Path is a mechanical device that provides fully compliant fire stopping for power and data cable management pathways.

It's easy to fit and/or retrofit and does not require a specialist fire contractor for system maintenance or upgrades.

Pre-fitted with the optimum amount of intumescent material to stop fire and smoke whether it's filled with cables or completely empty, EZ-Path is the perfect partner to Cablofil steel wire cable tray, Swifts cable ladder and Swifts perforated cable tray.

Find out more about EZ-Path at www.legrand.co.uk

product selection

PRODUCT SELECTION

STRAIGHT LENGTHS / DIVIDERS / COVERS

30 mm deep tray (CF30) / 54 mm deep tray (CF54)	11
FASCLIC AUTO (FCFA54) / FASCLIC (FCF54)	12
80 mm (CF80) / 105 mm (CF105) / 150 mm (CF150) deep tray	13
G-tray (CFG) / underfloor tray (UF30)	14
Mini tray (TXF35) / flexible tray (G-MINI)	15
Straight length dividers (COT) / bend dividers (COTFIL)	16
Covers (CVN / CP) / cover clips (F01/02/03)	17

COUPLERS AND FIXING KITS

Length to length couplers (EDRN / AUTOCLIC)	18
Joint strips (ED275 / ED1100)	18
Connectors (FASLOCK AUTO / FASSTRUT 41)	18
Base couplers (CEFAS / R15/25/35)	18
Fixing kits and components	19

WALL MOUNTING

Base and side wire mounting (UC50 / CAT30 / CAT40 / CM50 / CM50XL)	20
Cantilever arms (CSN / CSNC / CG / CB / CU / CLN / CC21S)	21 - 23
Stand-off brackets (R15/25/35/55)	23
Fast fix support rails (RCSN) / mounting rails (EDF / RE41SP)	24

CEILING MOUNTING

Central hangers (SF50/100 / SL50 / CEQ / UC50 / SAS / CE40 / CM50XL / SCF / UCS)	25 - 26
Trapeze hangers (AS / RCSN / EDF)	26 - 27
Profile mounting (CSNC)	26
Pendant mounting (EDF / PFREDF / RE41SP / PFR41S)	27

FLOOR / BEAM / OTHER MOUNTING

Floor mounting (CM50XL / RCSN / R15/25/35/55 / FTX / UC50 / UFC)	28 - 29
Beam mounting (CLMFAS / CLMU / EF)	29
Take-off plates (SBDN / SBD / EXSBD)	30
Universal mounting plates (CM50 / CM50XL / CAT40 / CM50XXL / CM50WL)	31
Luminaire supports (SL50/100)	32
Multifix base plates (MFM / MFPOLYA)	32
Cabling accessories (FAS ROLLER / DEV100 / CLIP / PA)	33
Earthing (BLF / GRIFEQUIP / GRIFEQUIP 2)	34
Fixings / fasteners / ancillary items	35

Cablofil®
key to finishes and symbols

■ Key to finishes

Symbol	Description
GS	Pre-galvanised
EZ	Electrogalvanising after manufacture
EZ+	Organically coated electrogalvanised after manufacture
GC	Hot dip galvanised after manufacture
DC	Geomet®
304L	Stainless steel 304 L
316L	Stainless steel 316 L
Z+	Continuous galvanisation before manufacture

For detailed information related to finishes, refer to p. 116-117

■ Recommended finishes for different environments

○ Recommended ◆ Possible	GS	EZ	EZ+	GC	DC	304L	316L
Internal installation, normal environment	○	○					
External installation, urban environment	◆	◆	◆	○	○		
Temporary external installation during construction phase	◆	◆	○				
Chemical industries, nitrate explosives, photography, decoration				◆	◆		○
Marine, harsh, sulphurous (weak concentration) environments				◆	◆		○
Acid or alkaline environments		◆		◆	◆	○	◆
Food production environment					○	○	
Halogen environment						◆	○

Typical atmospheric environments in relation to suitability of finishes

■ Colour code identification

The surface treatment can be identified by a colour coded clip
Each colour corresponds with a particular finish, i.e. yellow clip = EZ

1 : No safety edge

Please use Cat. No. when placing your order, see p. 11

All weights are given in Kilograms (kg) and are for a 3 m straight length

Sheared steel (particularly stainless steel) does have relatively sharp edges and protective gloves must be worn during handling

All dimensions (mm) are nominal

■ **Loading graphs**

The permissible load stated in this catalogue represents the load that Cablofil steel wire cable tray is guaranteed to be able to bear. It assumes loads are evenly spread and is given in daN/m. The standard permits a deflection equivalent to 1/100th of the span. Legrand imposes a stricter limit of 1/200th for both safety and aesthetic reasons. For example, Legrand voluntarily restricts deflection to 10 mm for a span of 2 m, whereas the standard would allow 20 mm.

Load tests carried out to IEC 61537 (safety factor 1.7 + joint 1/5th of the way along the span). Permissible load should include all cable loads and any other additional loads (eg: wind, snow)

P1500 = supports at 1 500 mm, see p. 120 for more information

NOTE:

For more information on loadings, see p. 125

■ **Finishes**

Standard stocked finish :

EZ Electrogalvanising after manufacture

Additional finishes :

GC Hot dip galvanised after manufacture

304L Stainless steel 304L

316L Stainless steel 316L

For detailed information related to finishes, refer to p. 116-117

→ **Couplers : see p. 48-51**

→ **Dividers : see p. 46**

EZ+ Organically coated electrogalvanised after manufacture

GC Hot dip galvanised after manufacture

304L Stainless steel 304L

316L Stainless steel 316L

For detailed information related to finishes, refer to p. 116-117

→ Couplers : see p. 48-51

→ Dividers : see p. 46

straight lengths - FCFA54 (FASCLIC AUTO)
 technical information

■ **Dimensions and weights**

54 mm → 50 mm → 600 mm → 3 m

Safety edge

Cat. Nos.	W mm	Weight (kg) EZ
FCFA54/50	50	1.97
FCFA54/100	100	2.40
FCFA54/150	150	3.20
FCFA54/200	200	4.15
FCFA54/300	300	6.23
FCFA54/400	400	9.26
FCFA54/450	450	9.89
FCFA54/500	500	9.89
FCFA54/600	600	10.53

Please use Cat. No. when placing your order, see p. 12

All weights are given in Kilograms (kg) and are for a 3 m straight length

■ **Assembly**

Unclip integral couplers from delivery position. Slide base plate (if applicable) to accept secondary length. Clip coupler and base to secure

For 300 - 600 mm wide tray, additional base plates are supplied to aid connection (1 x for 300 mm, 2 x for 400 - 500 mm and 3 x for 600 mm tray)

If a length of FCFA is cut, the coupler and base plate can be removed and reattached

Patented

Fast assembling

Fixing without nuts and bolts

Sheared steel (particularly stainless steel) does have relatively sharp edges and protective gloves must be worn during handling

All dimensions (mm) are nominal

■ **Loading graphs**

The permissible load stated in this catalogue represents the load that Cablofil steel wire cable tray is guaranteed to be able to bear. It assumes loads are evenly spread and is given in daN/m. The standard permits a deflection equivalent to 1/100th of the span. Legrand imposes a stricter limit of 1/200th for both safety and aesthetic reasons. For example, Legrand voluntarily restricts deflection to 10 mm for a span of 2 m, whereas the standard would allow 20 mm.

Load tests carried out to IEC 61537 (safety factor 1.7 + joint 1/5th of the way along the span). Permissible load should include all cable loads and any other additional loads (eg: wind, snow)

P2000 = supports at 2 000 mm, see p. 120 for more information

NOTE:

For more information on loadings, see p. 125

■ **Finishes**

Standard stocked finish :

EZ Electrogalvanising after manufacture

For detailed information related to finishes, refer to p. 116-117

→ **Dividers : see p. 46**

straight lengths - FCF54 (FASCLIC)

technical information

■ Dimensions and weights

54 mm → 50 mm → 300 mm → 3 m

covers and cover clips – CVN - CP - F01 - F02 - F03

technical information

- CVN – covers (1 m length)
- CP – covers (2 m length)
- F01 / F02 / F03 – cover clips

CVN - covers

Supplied in packs of 3 x 1 m lengths, CVN covers are available for 50 mm to 600 mm wide steel wire cable tray in 30 mm to 105 mm depths

CP - covers

Supplied in packs of 1 x 2 m lengths, CP covers are available for 50 mm to 600 mm wide steel wire cable tray in 30 mm to 105 mm depths

F01 / F02 / F03 - cover clips

Supplied in packs of 25, F01 clips are used with 30 mm deep tray; F02 clips are used with 54 mm and 105 mm deep tray and F03 clips are used with 80 mm deep tray. Clips can be used with both CVN and CP covers

Installation

CVN and CP covers can be fitted directly with integral tabs or alternatively with optional cover clips

Use optional cover clips to secure covers

Assembly

Securing CVN / CP covers to steel wire cable tray

Fast assembling

Fixing without nuts and bolts

Securing F01/F02/F03 cover clips to CVN / CP covers

Squeeze clips at base and apply to underside of tray

Fast assembling

Fixing without nuts and bolts

Fix the top of the clip into the groove along the edge of the lid to secure

couplers – length to length
EDRN - AUTOCLIC

■ **EDRN – couplers**

EDRN couplers are supplied with one fixing tool in each pack of 50 couplers. No additional fasteners or tools required

■ **Installation**

EDRN couplers are used in pairs across the side rail joint of two lengths of tray as shown

■ **Assembly**

1. Position coupler as indicated
2. Twist coupler into place
3. Use fixing tool (supplied) to pull coupler into place

Patented

Fast assembling

Fixing without nuts and bolts

The table below indicates the recommended quantity of EDRN couplers required per width of steel wire cable tray
Note: for base coupling, CEFAS (p. 50) can be used as an alternative to EDRN couplers

A → ← A = side coupling = base coupling

Coupler	50		100		150		200		300		400 → 500		600	
	A	B	A	B	A	B	A	B	A	B	A	B	A	B

■ **AUTOCLIC – couplers**

AUTOCLIC couplers are supplied in packs of 50. Rapid fit with screwdriver. No additional fasteners required

■ **Installation**

AUTOCLIC couplers are used in pairs across the side rail joint of two lengths of tray as shown

■ **Assembly**

1. Insert coupler
2. Twist into position
3. Pull into place with screwdriver (not supplied)

Fast assembling

Fixing without nuts and bolts

Patented

Fit Autoclic to both sides of one length of tray and insert into second length as shown

OR

Fit Autoclic in an offset pattern on alternate ends of each length as shown

The table below indicates the recommended quantity of AUTOCLIC couplers required per width of steel wire cable tray
Note: wider widths need the addition of either CEFAS (p. 50) or KITASSTR (p. 51) to provide additional support to the base

A → ← A = side coupling = base coupling

Coupler	50		100		150 / 200		300		400 → 500		600

joint strips – length to length coupling

ED275 - ED1100

Use to provide additional support for length to length coupling. Fasteners are required to secure joint strips to the tray (see below). ED275 supplied in packs of 50 without fasteners. ED1100 supplied singly without fasteners. Not suitable for 30 mm or 80 mm deep tray.

Installation

Joint strips attach to the side wire of the tray across the joint when used as a length to length coupler. Fasteners required (not supplied)

Assembly

For lighter loads, use a single fastener

For heavier loads, increase the number of fasteners

The table below indicates the recommended quantity of ED275/ED1100 joint strips per width and also KITASSTR (p. 50) as a base coupler

A → ← A = side coupling B = base coupling (CAA)

couplers – fabricated fittings

FASLOCK AUTO

FASLOCK AUTO is used to form radius bends. For 100 mm and 200 mm wide steel wire cable tray use FASLOCK AUTO S (small). For 300 mm wide to 600 mm wide tray use FASLOCK AUTO XL (large). Supplied in packs of 25. No additional fasteners or tools required. For detailed installation instructions see p. 97-99

Installation

FASLOCK AUTO is positioned on the internal angle of a radius bend after steel wire cable tray has been cut. No fasteners required

Assembly

Clip FASLOCK AUTO into place. Safety edges protect both the cables and the installer

Patented

Fast assembling

Fixing without nuts and bolts

base couplers – length to length
CEFAS - R15/25/35

■ **CEFAS – base couplers**

CEFAS couplers are used as base couplers or in conjunction with EDRN or AUTOCLIC as side rail couplers (p. 48). Can also be used as a luminaire support. Supplied in packs of 50. No additional fasteners or tools required

Installation

CEFAS used as a base coupler between two lengths of steel wire cable tray. No fasteners required

■ **Assembly**

1. and 2. insert CEFAS into the base of the tray as shown

3. slide into place to secure
 No fasteners required

wall mounting – light duty
UC50

■ **UC50 – support cradles**

Use as a support cradle for 50 mm wide steel wire cable tray in 30 mm or 54 mm depths
Can be mounted directly onto the wall - horizontally or vertically, or onto wall mounted cantilever arms using fasteners (see below for assembly information)
Can also be ceiling mounted in conjunction with CEQ (see p. 67) or floor mounted (see p. 80). Supplied singly without fasteners

■ **Installation**

Mount directly onto wall using fasteners (not supplied)

Mount onto wall mounted cantilever arms using fasteners (not supplied)

■ **Assembly**

Securing UC50 to steel wire cable tray

Fast assembling

Fixing without nuts and bolts

Bend tabs with screwdriver to secure to steel wire cable tray

Securing UC50 to cantilever arm

Use BTRCC 6 x 20 (see p. 35) to secure to cantilever arms

wall mounting – medium duty
CSN

■ **CSN – profile cantilever arms**
INTERFAS – adaptor plate
EPVCSN – end cap

CSN - profile cantilever arms

Use to support 100 mm to 450 mm wide steel wire cable tray in 30 mm and 54 mm depths. Can be wall mounted using fasteners (see below) or pendant drop mounted using EDF mounting rail (see p. 76). Incorporate slot and tab design for easy fixing. Supplied singly without fasteners

INTERFAS - adaptor plate

Used as a tool-less mounting device to attach CSN profile cantilever arms to channel section
Supplied singly

EPVCSN - end cap

PVC end cap for CSN profile cantilever arms
Supplied singly

■ **Installation**

Mount directly onto wall using fasteners (not supplied)

Slot CSN into INTERFAS. No additional fasteners required

■ **Assembly**

Securing CSN to channel

Mount onto wall mounted channel support using INTERFAS

Securing CSN to steel wire cable tray

Patented

Fast assembling

Fixing without nuts and bolts

Slot base wires of the tray into the cantilever arm and bend tabs with screwdriver to secure, as shown in the FAS diagram above

wall mounting – horizontal or vertical mounting

R15/25/35 – R55

■ R15/25/35 – stand-off brackets – couplers R55 – stand-off brackets

R15/25/35 - stand-off brackets

Use to fix 100 mm to 600 mm wide steel wire cable tray in 30 mm to 105 mm depths directly onto the wall. Can be used for horizontal and vertical mounting of cable tray runs. Can also be used for floor mounting (see p. 79) and as a base coupler (see p. 50). Incorporates slot and tab design for easy fixing. Supplied singly without fasteners

R55 - stand-off brackets

Use to fix 100 mm to 600 mm wide steel wire cable tray in 30 mm to 105 mm depths directly onto the wall. Can be used for horizontal and vertical mounting of cable tray runs. Can also be used for floor mounting (see p. 79). Incorporates slot and tab design for easy fixing. Supplied singly without fasteners

■ Installation

R15/25/35

Mount directly onto wall using fasteners (not supplied). Vertical mounting of tray shown - horizontal mounting also possible

R55

Mount directly onto wall using fasteners (not supplied). Vertical mounting of tray shown - horizontal mounting also possible

■ Assembly

Securing R15/25/35/55 to steel wire cable tray

FAS
FAST ASSEMBLING SYSTEM

Slot base wires of the tray into the cantilever arm and bend tabs with screwdriver to secure, as shown in the FAS diagram

Fast assembling

Fixing without nuts and bolts

NOTE :

200 to 300 mm wide tray requires 2 x brackets mounted side by side across the width of the tray. 400 to 600 mm wide tray requires 3 x brackets

→ For base coupling : see p. 50

→ For floor mounting : see p. 79

ceiling mounting – central hangers

SF50 – SF100 – SL50

■ SF50 – SF100 – central hangers

Used with threaded rod and fasteners to form a central hanger to suspend steel wire cable tray from ceiling. Can also be bolted directly to the ceiling

Use SF50 for 50 mm wide steel wire cable tray in 30 mm and 54 mm depths and SF100 for 100mm wide tray in 30 mm and 54 mm depths
Incorporates slot and tab design for easy fixing
Supplied singly without fasteners

■ Installation

SF50 and SF100 used to suspend tray from ceiling with threaded rod and fasteners (not supplied). Provision of base hole enables easy access for installation

Suspended with threaded rod and fasteners (not supplied)

Bolted directly to ceiling. Fasteners not supplied

■ Assembly

Suspending SF50 / SF100 from ceiling

Securing SF50 / SF100 to steel wire cable tray

Side wires of the tray fix into bracket tabs. No additional fixings required to secure tray to bracket

Fast assembling

Fixing without nuts and bolts

ceiling mounting – central hangers

CEQ – UC50

■ CEQ – central hanger brackets + UC50 – support cradles

CEQ - central hanger brackets

Use with UC50, threaded rod and fasteners to form a central hanger to suspend 50 mm wide steel wire cable tray in 30 mm and 54 mm depths from the ceiling
Supplied singly without fasteners

UC50 - support cradles

Use as a support cradle for 50 mm wide steel wire cable tray in 30 mm or 54 mm depths
Can be ceiling mounted in conjunction with CEQ or floor mounted (see p. 80).
Can also be mounted directly onto the wall - horizontally or vertically, or onto 41 mm channel profiles (see p. 52)
Supplied singly without fasteners

■ Installation

CEQ + UC50 used to suspend tray from ceiling with threaded rod and fasteners (not supplied)

Slot alignment allows for onsite adjustment

■ Assembly

Suspending CEQ + UC50 from ceiling

Securing UC50 to CEQ

Use TR06 (M6 x 3m) threaded rod and 2 x EEC6 (6mm) hex nuts (not supplied) to suspend CEQ from ceiling

Use 1 x BTRCC (not supplied) to attach UC50 to CEQ, as shown in the side view illustration

Securing UC50 to steel wire cable tray

Bend tabs with screwdriver or pliers to secure UC50 to side rail of tray

→ For wall mounting : see p. 52

→ For floor mounting : see p. 80

ceiling mounting – central hangers

SAS

■ SAS – suspension hangers

Use with threaded rod and fasteners to form a central hanger to suspend 100 mm and 150 mm wide steel wire cable tray in 30 mm and 54 mm depths from the ceiling
 Incorporates slot and tab design for easy fixing
 Supplied singly without fasteners

■ Installation

Mount SAS along the length of the tray when using 100 mm wide steel wire cable tray
 Use with threaded rod and fasteners (not supplied)

Mount SAS across the width of the tray when using 150 mm wide steel wire cable tray. Use with threaded rod and fasteners (not supplied)

Note :
 The threaded rod will sit off centre due to the position of the base wire in the tray length

■ Assembly

Suspending SAS from ceiling

Use TR06 (M6 x 3m) threaded rod and 2 x EEC6 (6mm) hex nuts (not supplied) to suspend SAS from ceiling

Securing SAS to steel wire cable tray

Fast assembling

Fixing without nuts and bolts

Base wires of the tray fix into hanger tabs. No additional fixings required to secure tray to SAS hanger
 Use blade of screwdriver to click SAS firmly into place

■ Dimensions and weights

ceiling mounting – central hangers

SCF – PFSCF – EXT-SCF

■ SCF – central hangers + PFSCF – locating ceiling plate + EXT-SCF – rod sheaths

SCF - central hangers

Use with threaded rod and fasteners to form a central hanger to suspend 200 mm to 600 mm wide steel wire cable tray in 30 mm and 54 mm depths from the ceiling. Incorporates slot and tab design for easy fixing. Used in conjunction with PFSCF locating ceiling plate and EXT-SCF rod sheath. Supplied singly without fasteners

PFSCF - locating ceiling plate

Locating plate for use with SCF. Supplied singly without fasteners

EXT-SCF - rod sheaths

Extension rod sheath for use with SCF. EXT-SCF helps to protect cables from damage. Supplied singly without fasteners

■ Installation

SCF central hanger in situ with PFSCF locating ceiling plate and EXT-SCF rod sheath covering threaded rod

SCF can support 2 x tray runs up to 200 mm wide side by side

2 x SCF can be used in a tier arrangement

EXT-SCF can be used with threaded rod of any length

PFSCF can be used to spread the load and further stabilise the installation

■ Assembly

Suspending SCF from ceiling

Installation steps

- 1) Install threaded rod into ceiling fixing, such as ceiling anchor (not supplied)
- 2) On floor level, assemble wire mesh onto SCF
- 3) Attach EXT-SCF rod sheath and PFSCF locating ceiling plate to SCF central hanger
- 4) Offer assembly up to pre-fitted threaded rod
- 5) Secure assembly with washers and hexagon nuts

■ Assembly (continued)

Securing SCF to steel wire cable tray

Slot base wires of the tray into the SCF hanger and bend tabs with screwdriver to secure, as shown in the FAS diagram

Fast assembling

Fixing without nuts and bolts

All dimensions (mm) are nominal

ceiling mounting – central hangers

UCS – RCSN

■ UCS – ceiling support brackets + RCSN – fast fix support rails

UCS - ceiling support brackets

Use with RCSN or channel to form a central hanger to suspend 2 parallel runs of 50 mm (100 mm using RCSN) to 300 mm wide steel wire cable tray in 30 mm and 54 mm depths from the ceiling. Supplied singly without fasteners

RCSN - fast fix support rails

Use with UCS (above) or threaded rod to form a central hanger to suspend steel wire cable tray from the ceiling. Can also be used for horizontal and vertical wall mounting of cable tray runs (see p. 65) and for floor mounting (see p. 78). Incorporates slot and tab design for easy fixing. Supplied singly without fasteners

■ Installation

UCS ceiling support bracket + RCSN fast fix support rail to support 2 x parallel runs of steel wire cable tray from the ceiling

UCS and RCSN supporting parallel runs of cable tray

UCS and channel supporting parallel runs of cable tray

■ Assembly

Suspending UCS + RCSN from ceiling

BTRL 8 x 15

Use BTRL 8 x 15 fasteners to secure RCSN support rail or channel support to UCS

Securing RCSN to steel wire cable tray

Slot base wires of the tray into the RCSN support rail and bend tabs with screwdriver to secure, as shown in the FAS diagram above

Fast assembling

Fixing without nuts and bolts

→ For wall mounting : see p. 65

→ For floor mounting : see p. 78

■ Assembly (continued)

Securing channel support to steel wire cable tray

Use FASTRUT 41 (see p. 18) to secure steel wire cable tray to channel lengths

ceiling mounting – trapeze

RCSN

■ RCSN – fast fix support rails

Use with threaded rod and fasteners to form a trapeze hanger to suspend 100 mm to 600 mm wide steel wire cable tray in 30 mm to 105 mm depths from the ceiling.
Can be mounted directly onto the wall (see p. 65) or floor mounted (see p. 78).
Incorporates slot and tab design for easy fixing. Supplied singly without fasteners.

■ Installation

RCSN support rails suspending wire tray from the ceiling with threaded rod and fasteners (not supplied)

■ Assembly

Suspending RCSN from ceiling

Use 2 x TR06 or TR08 (M6 / M8 x 3m) threaded rod and 4 x EEC6 or EEC8 (6 or 8mm) hex nuts (not supplied) to suspend RCSN from ceiling

Securing RCSN support rail to steel wire cable tray

FAS
FAST ASSEMBLING SYSTEM

Slot base wires of the tray into the cantilever arm and bend tabs with screwdriver to secure, as shown in the FAS diagram above

Patented

Fast assembling

Fixing without nuts and bolts

■ Dimensions and weights

↓↑: 30 → 105 mm ↔: 100 → 600 mm

To select the correct size RCSN for trapeze hanging, add 100 mm to the chosen tray width to allow for fixing of threaded rod either side of the tray, e.g. if using 200 mm wide tray, use a 300 mm wide RCSN

Cat. No.	L mm	Weight (kg)			
		GS	GC	304L	316L

ceiling mounting – trapeze

EDF

EDF – profile pendants / mounting rails

Use with threaded rod and fasteners to form a trapeze hanger to suspend 100 mm to 600 mm wide steel wire cable tray in 30 mm to 105 mm depths from the ceiling or use with PFREDF to form a pendant installation (opposite).

Can be mounted directly onto the wall for use with cantilever arms (see p. 58)

Supplied singly without fasteners

Installation

EDF mounting rails suspending wire tray from the ceiling with threaded rod and fasteners (not supplied)

Assembly

Suspending EDF from ceiling - trapeze mounting

Use 2 x TR06 or TR08 (M6 / M8 x 3m) threaded rod and 4 x EEC6 or EEC8 (6 or 8mm diameter) hex nuts (not supplied) to suspend EDN from ceiling

Securing EDF mounting rail to steel wire cable tray

Use 1 x BTRCC 6 x 20 and 1 x CE25 to secure 50 mm to 200 mm tray EDF
For 300 mm to 600 mm tray use 2 x BTRCC 6 x 20 and 2 x CE25

Dimensions and weights

Height: 30 → 105 mm Length: 100 → 600 mm

To cut the correct size EDF for trapeze hanging, add 50 mm to the chosen tray width to allow for fixing of threaded rod either side of the tray, e.g. if using 200 mm wide tray, cut EDF to 250 mm wide

ceiling mounting – pendant

PFREDF

■ PFREDF – pendant mounting plates EDF – profile pendants / mounting rails

PFREDF

Use as a ceiling mounting plate in conjunction with EDF to form a pendant drop to suspend 100 mm to 600 mm wide steel wire cable tray in 30 mm to 105 mm depths from the ceiling via cantilever arms (see p. 56-62).

Incorporates slot and tab design for easy fixing of EDF
Supplied singly without fasteners

EDF

Use with threaded rod and fasteners to form a trapeze hanger to suspend 100 mm to 600 mm wide steel wire cable tray in 30 mm to 105 mm depths from the ceiling or use with PFREDF to form a pendant installation (opposite).

Can be mounted directly onto the wall for use with cantilever arms (see p. 58)

Supplied singly without fasteners

■ Installation

PFREDF pendant mounting plate with EDF mounting rail. Secure to ceiling using fasteners (not supplied)

Cantilever arms can be mounted to one side of the EDF mounting rail. See p. 56-62

■ Assembly

Suspending EDF from ceiling - pendant mounting

Bend tabs to secure to PFREDF pendant mounting plate to EDF mounting rail.
No fasteners required

Fast assembling

Fixing without nuts and bolts

floor mounting

UFC - CSN

■ UFC – clamp unit / CSN – profile cantilever arms

UFC - clamp unit

Use in conjunction with CSN cantilever arms or RCSN mounting rail (see p. 82) to clamp to underfloor pedestal supports, forming an underfloor support for steel wire cable tray runs. Supplied singly with U bolt and bolts.

CSN - profile cantilever arms

Use to support 100 mm to 450 mm wide steel wire cable tray in 30 mm and 54 mm depths. Can be wall mounted (see p. 56) or pendant drop mounted using EDF mounting rail (see p. 76). Incorporate slot and tab design for easy fixing. Supplied singly without fasteners.

EPVCSN - end cap

PVC end cap for CSN profile cantilever arms. Supplied singly.

■ Installation

UFC with CSN

CSN is secured to UFC using U bolt and fasteners (supplied)

■ Assembly

Securing CSN to steel wire cable tray

floor mounting
UFC - RCSN

■ **UFC – clamp unit / RCSN - fast fix support rails**

UFC - clamp unit

Use in conjunction with RCSN mounting rail or CSN cantilever arms (see p. 81) to clamp to underfloor pedestal supports, forming an underfloor support for steel wire cable tray runs. Supplied singly with U bolt and nuts

RCSN - fast fix support rails

Use to support 100 mm to 600 mm wide steel wire cable tray in 30 mm to 105 mm depths. Use in conjunction with UFC or mount directly to the floor. Can also be wall mounted (see p. 65) or to form a trapeze hanger using threaded rod (see p. 74). Incorporate slot and tab design for easy fixing. Supplied singly without fasteners

■ **Installation**

RCSN is secured to UFC using U bolt and fasteners (supplied)
Note: if 600 mm floor spacing being used, use 550 mm RCSN or below

Mount RCSN directly onto floor using fasteners (not supplied)

■ **Assembly**

Securing RCSN to UFC clamp unit

Rest RCSN on U bolt of UFC and secure down using 2 x BTRCC 6 x 20

Securing RCSN to steel wire cable tray

Patented

Fast assembling

Fixing without nuts and bolts

beam mounting

CLMFAS – RCSN

CLMFAS – beam clamps / RCSN – fast fix support rails

CLMFAS - beam clamps

Use as a clamp to attach RCSN mounting rail to beams
Supplied singly without fasteners

RCSN - fast fix support rails

Use to support 50 mm to 600 mm wide steel wire cable tray in 30 mm to 105 mm depths in a beam mounting situation. Can also be wall mounted (see p. 65), floor mounted (see p. 82) or used to form a trapeze hanger using threaded rod (see p. 74)
Incorporate slot and tab design for easy fixing. Supplied singly without fasteners

Installation

CLMFAS with RCSN

CLMFAS is secured to beams at either side with fasteners (not supplied). RCSN fast fit support rails simply pass through the opening in the CLMFAS clamp and sit on the underside of the beam
42 mm to 100 mm wide beams can be accommodated

Assembly

Securing CLMFAS to beams and to RCSN

CLMFAS is secured to beams at either side with 1 X M8 x 20 fastener per clamp (not supplied).
RCSN fast fit support rails simply pass through the opening in the CLMFAS clamp and sit on the underside of the beam

beam mounting
CLMU - EDF

■ **CLMU – beam clamps / EDF – pendants / mounting rails**

CLMU - beam clamps

Use as a clamp to attach EDF mounting rail to beams
Supplied singly without fasteners

EDF - pendants / mounting rails

Use to support 50 mm to 600 mm wide steel wire cable tray in 30 mm to 105 mm depths in a beam mounting situation. Can also be wall mounted (see p. 58-61), or trapeze and pendant mounted from the ceiling (see p. 75-76)
Supplied singly without fasteners

■ **Installation**

CLMU with EDF

CLMU is secured to beams at either side with fasteners (not supplied). EDF mounting rails pass through the opening in the CLMU clamp and sit on the underside of the beam. 42 mm to 100 mm wide beams can be accommodated

■ **Assembly**

Securing CLMU to beams and to EDF

CLMU is secured to beams at either side with 1 X M8 x 20 fastener per clamp (not supplied)
EDF mounting rails pass through the opening in the CLMFAS clamp, sit on the underside of the beam and are secured with the fastener

Securing EDF mounting rail to steel wire cable tray

Use 1 x BTRCC 6 x 20 and 1 x CE25 to secure 50 mm to 200 mm tray EDF
For 300 mm to 600 mm tray use 2 x BTRCC 6 x 20 and 2 x CE25

→ For wall mounting : see p. 58-61

→ For ceiling (pendant / trapeze) mounting : see p. 75-76

All dimensions (mm) are nominal

beam mounting EF

EF – adjustable beam clamps

EF adjustable beam clamps can be used to support 100 mm to 300 mm wide steel wire cable tray in 30 mm to 54 mm depths along the length of a beam. Can also be used to trapeze mount cable tray using threaded rod. Supplied singly without fasteners

Installation

EF is secured to beams at either side with fasteners (not supplied)
Steel wire cable tray can be mounted directly to the channel piece, or suspended below using threaded rod

Assembly

Securing EF adjustable beam clamp to steel wire cable tray

Use 1 x BTRCC 6 x 20 and 1 x CE25 to secure EF to tray

Dimensions and weights

30 → 54 mm 100 → 300 mm

H denotes the adjustable height range (see table below)

other mounting – universal mounting plates

CM50 – CM50XL – CAT40

■ CM50 – universal mounting plates (small) / CM50XL – universal mounting plates (large) / CAT40 – channel fixing plates

CM50 - universal mounting plates (small)

Mount to the side of steel wire cable tray as an ancillary mounting plate. Use with 50 mm to 600 mm wide steel wire cable tray in 30 mm, 54 mm and 105 mm depths. CM50 can also be used to mount cable tray to the wall (see p 55)

Incorporate slot and tab design for easy fixing
Supplied singly. No fasteners required

CM50XL - universal fixing plates (large)

Mount to the side of steel wire cable tray as an ancillary mounting plate. Use with 50 mm to 600 mm wide steel wire cable tray in 30 mm, 54 mm and 105 mm depths. CM50XL can also be used to mount cable tray to the wall (see p 55), floor (see p. 78) or ceiling (see p. 69)

Incorporate slot and tab design for easy fixing
Supplied singly. No fasteners required

CAT40 - channel fixing plates

Mount to the side of steel wire cable tray as an ancillary mounting plate. Use with 50 mm to 600 mm wide steel wire cable tray in 30 mm, 54 mm and 105 mm depths. CAT40 can also be used to mount cable tray to the wall (see p 54)

Supplied singly. No fasteners required

■ Installation and assembly

CM50, CM50XL and CAT 40 plates are clipped onto the side rail of the tray to accommodate ancillary items. No fasteners are required to attach plates onto tray

Fixing without nuts and bolts

CM50 and CM50XL in side profile with ancillary items mounted to the flat side

■ Dimensions and weights

30 / 54 / 105 mm 50 → 600 mm

Typical atmospheric environments in relation to suitability of finishes

Preventing corrosion

In planning any cabling or support installation the choice of an appropriate corrosion resistant finish is always a key issue at the specification stage. The correct choice of finish has long term implications and is crucial for ensuring the longevity (and aesthetics) of the complete installation in order to meet with the client's expectations.

It is vital that the finish specified for the equipment is capable of providing lifetime protection from corrosion within the intended environment - ideally with some margin of safety.

The following pages give information on how corrosion occurs. Contact our technical team on +44 (0) 845 605 5334 for further information.

Corrosion occurs on all metals to some extent. With some, such as stainless steel, its effects

are usually only slight but even then the presence of certain chemicals or physical contact with other metals may cause rapid corrosion. It is therefore important to consider every aspect of the environment surrounding any intended installation in order to choose a material or finish which will minimise the risk of damage to the support system through the effects of corrosion.

1 Chemical (atmospheric) corrosion

Few metals will suffer corrosion damage in a dry, unpolluted atmosphere at a normal ambient temperature. Unfortunately atmospheric pollutants are likely to be present to some degree in most situations where support systems will be installed, thus mild chemical corrosion is normal in almost all situations.

Any support installation which will be situated in an area where higher concentrations of chemicals exist must receive more detailed consideration in order to select a finish which provides the best combination of initial cost and expected life. More detailed information is available upon request, please contact us on +44 (0) 845 605 5334.

2 Electrochemical (galvanic) corrosion

When two dissimilar metals are in contact and become damp it is possible for corrosion to be induced in one of the metals. Such corrosion may progress rapidly and cause considerable damage so it is important to consider and, if necessary, take steps to eliminate this process occurring.

Electrochemical corrosion takes place because the two different metals each behave as electrodes and the moisture as the electrolyte in a simple battery; as with any battery the resulting flow of current will cause corrosion of the anode.

The likely effects of this reaction can be predicted using the Galvanic Series.

Partner metal	Stainless steel	Nickel	Copper	Brass	Tin	Steel	Aluminium	Chromium	Zinc
Stainless steel	0								
Nickel	180								
Copper	320	140							
Brass	400	220	80						
Tin	550	370	230	150					
Steel	750	570	430	350	200				
Aluminium	840	660	520	440	290	90			
Chromium	950	770	630	550	400	200	110		
Zinc	1150	970	830	750	600	400	310	200	0

Differences in potential are expressed in millivolts. Beneath the red line, the metal involved is attacked.

3 The merits of Zinc

The Galvanic Series does show why zinc is such a useful corrosion resistant coating for mild steel.

Firstly, it forms an impervious zinc barrier around the steel, coating it with a metal whose own rate of chemical corrosion is both low and predictable in most situations.

Secondly, if the coating is damaged at any point (e.g. at a cut edge) the zinc surrounding the damaged area becomes the anode of the electrolytic cell and is sacrificially corroded away very slowly in preference to the underlying steel. This ensures the strength of the steel structure remains unaffected.

Because zinc appears near the top of the Galvanic Series it will act as a sacrificial anode in relation to most other metals; thus its relatively low cost and the ease with which it can be applied as a galvanised coating on steel means that it continues to be the most commonly specified protective finish for support systems.

Life expectancy of zinc coatings

The resistance of galvanising to atmospheric corrosion depends on a protective film which forms on the surface of the zinc. When the steel is withdrawn from the galvanising bath the zinc has a clean, bright, shiny surface. Over time the appearance will change to a dull grey patina as the surface reacts with oxygen, water and carbon dioxide in the atmosphere. A complex but tough, stable and protective layer is formed which adheres to the zinc. Contaminants in the atmosphere affect the nature of this protective film.

The most significant contaminant which will accelerate the corrosion rate of zinc is sulphur dioxide (SO₂) and it is the presence of SO₂ which largely controls the atmospheric corrosion of zinc.

The Zinc Millennium Map

The Galvanizers Association has undertaken significant research based upon the positioning of reference canisters placed throughout the UK and the Republic of Ireland to establish background corrosion rates for 10 km² grids which has resulted in the formation of The Zinc Millennium Map.

With the correct use of the map specific locations can be analysed for average zinc corrosion rates per year.

Further information is available at www.galvanizing.org.uk.

4 Common corrosion situations

The most common occurrences of contact between dissimilar metals within support systems are :

- a. Where stainless steel components are being fixed to a carbon steel structure
- b. Where galvanised or zinc plated components are being fixed onto a stainless steel support system

Description of typical atmospheric environments related to the estimation of corrosivity categories

Corrosivity category C. Corrosion rate for zinc (based upon one year exposures), r _{corr} (µm.a ⁻¹) and corrosion level	Typical environments (examples)	
	Indoor	Outdoor
C1 r _{corr} ≤ 0.1 Very low	Heated spaces with low relative humidity and insignificant pollution, e.g. offices, schools, museums	Dry or cold zone, atmospheric environment with very low pollution and time of wetness, e.g. certain deserts, central Arctic / Antarctica
C2 0.1 < r _{corr} ≤ 0.7 Low	Unheated spaces with varying temperature and relative humidity. Low frequency of condensation and low pollution, e.g. storage, sport halls	Temperate zone, atmospheric environment with low pollution (SO ₂ < 5 µg/m ³), e.g.: rural areas, small towns. Dry or cold zone, atmospheric environment with short time of wetness, e.g. deserts, sub-arctic areas
C3 0.7 < r _{corr} ≤ 2 Medium	Spaces with moderate frequency of condensation and moderate pollution from production process, e.g. foodprocessing plants, laundries, breweries, dairies	Temperate zone, atmospheric environment with medium pollution (SO ₂ : 5 µg/m ³ to 30 µg/m ³) or some effect of chlorides, e.g. urban areas, coastal areas with low deposition of chlorides, subtropical and tropical zones with atmosphere with low pollution
C4 2 < r _{corr} ≤ 4 High	Spaces with high frequency of condensation and high pollution from production process, e.g. industrial processing plants, swimming pools	Temperate zone, atmospheric environment with high pollution (SO ₂ : 30 µg/m ³ to 90 µg/m ³) or substantial effect of chlorides, e.g. polluted urban areas, industrial areas, coastal areas without spray of salt water, exposure to strong effect of de-icing salts, subtropical and tropical zones with atmosphere with medium pollution
C5 4 < r _{corr} ≤ 8 Very high	Spaces with very high frequency of condensation and/or with high pollution from production process, e.g. mines, caverns for industrial purposes, unventilated sheds in subtropical and tropical zones	Temperate and subtropical zones, atmospheric environment with very high pollution (SO ₂ : 90 µg/m ³ to 250 µg/m ³) and/or important effect of chlorides, e.g. industrial areas, coastal areas, sheltered positions on coastline
CX 8 < r _{corr} ≤ 25 Extreme	Spaces with almost permanent condensation or extensive periods of exposure to extreme humidity effects and/or with high pollution from production process, e.g. unventilated sheds in humid tropical zones with penetration of outdoor pollution including airborne chlorides and corrosion-stimulating particulate matter	Subtropical and tropical zones (very high time of wetness), atmospheric environment with very high pollution (SO ₂ higher than 250 µg/m ³), including accompanying and production pollution and/or strong effect of chlorides, e.g. extreme industrial areas, coastal and offshore areas with occasional contact with salt spray

Finishes

Coated and stainless steels

1. Coated steels
2. Stainless steels

Coated and stainless steels

1 Coated steels

GS Pre-galvanised

EN 10346 (accessories only)

Before manufacture, a coating of zinc is deposited by continuous immersion on to the steel.

EZ Electrogalvanising after manufacture¹

EN 12329 standard

This coating process is often referred to as bright zinc plating (BZP). Electroplating with zinc may be used when a smooth bright decorative finish is required. Parts can be coloured or colourless depending on the type of passivation process used. It is generally used for internal applications where a low degree of corrosion resistance is acceptable. Electroplating involves connecting the metal substrate to a negative terminal of a direct current source and another piece of metal to a positive pole, and immersing both metals in a solution containing ions of the metal to be deposited, in this case zinc.

Ongoing protection

When steel wire cable tray is cut, the level of protection is not affected. The jaws of the bolt cropper drag a layer of zinc across the cut end which forms a protective layer.

GC Hot dip galvanised after manufacture

BS EN ISO 1461 standard

Hot dip galvanising after manufacture is an excellent, economical protective finish used on support systems in many industrial and commercial applications.

Background

The galvanised coating is applied as a final manufacturing process by immersing a steel component (after various pre-treatments) in a large bath of molten zinc; the zinc forms an alloy with the steel substrate and protects the steel from corrosion in two ways.

Firstly, the zinc coating surrounds the base steel with a total, tough physical barrier preventing corrosion of the steel by the surrounding atmosphere. Secondly, if steel does become exposed, e.g. at a cut edge, the zinc coating acts as a sacrificial anode and

will be gradually corroded in preference to the underlying steel. Corrosion products from the zinc will also be deposited onto the steel, effectively re-sealing the surface and maintaining the integrity of the barrier.

NOTE : Any white marks due to the formation of zinc hydroxycarbonate which might appear on the surface have no influence on the corrosion resistance. This is in fact the very principle on which galvanic protection is based.

DC Geomet®

Geomet is a treatment based on zinc and aluminium. As it does not contain any chromium VI (hexavalent), it complies with the RoHS Directive.

Offering protection equivalent to GC, it is used for small accessories and fixings which are difficult to hot dip galvanise.

EZ+ EZ+

EZ+ is an additional organic finish applied over standard electrozinc plated steel wire cable trays, offering a durable surface treatment for temporary external installations during the construction phase.

Cablofil EZ+ brings with it a Class 6 alternative to a hot dip galvanised finish (GC) according to IEC 61537. Salt spray tests carried out demonstrate that EZ+ exceeds the performance of a standard hot dip galvanised finish (no red rust after more than 550 hours exposure to salt spray test, according to ISO 61537). The same 'Class 6' classification is achieved after products are subjected to a simulated 2 year ageing process under UV conditions.

Z+ Z+

Alloy compound of 94% zinc, 3% aluminium and 3% magnesium, coated steel with high elastic yield. Compatible with hot dip galvanised products and has Class 8 properties according to IEC 61537. Products self-regenerate when cut. Z+ products are compatible with hot dip galvanised / EZ+.

Powder coated

Resin-based paint is applied to the steel wire cable tray using an electrostatic powder and then cured in an oven. The entire range of RAL colours can be obtained. Mainly used for aesthetic reasons and to help identify cable routes, it offers very good corrosion resistance.

Figures for salt spray tests, baseline 100 hours : EZ

2 Stainless steels

For all practical purposes most stainless steel services supports can be regarded as maintenance free and suffering no corrosion. Inevitably there is a relatively high price to pay for these attractive properties but, in aggressive environments or where the cost or inconvenience of gaining subsequent maintenance access is prohibitive, this initial cost premium may well be justified.

Background

Stainless steel contains a high proportion of chromium (usually at least 17%) and the steel's remarkable immunity to corrosive attack is conferred by the chromium-rich oxide film which occurs naturally on its surface. This invisible film is not only inert and tightly bonded to the surface, it also re-forms quickly if the surface is damaged in any way.

The fire resistance of stainless steel is particularly noteworthy; tests have demonstrated that stainless steel cable supports can be expected to maintain their integrity for considerable periods even when exposed to direct flame temperatures exceeding 1,000°C. This may be an important consideration where the electrical circuits being supported provide for emergency power or control systems.

Stainless steel is also used where hygiene is a major consideration. Its advantages in such applications are again its excellent resistance to the various chemicals and washes which are frequently used for cleaning purposes and the smoothness of surface (depending on the finish specified) which minimises the soiling or contamination that can take place.

304L Stainless steel 304 L

EN 10088-2 standard AISI 304L – X2CrNi18.09 – 1.4307

Offers good corrosion resistance against soft water, normal environments and food products (except mustard and white wine).

316L Stainless steel 316 L

EN 10088-2 standard AISI 316L – X2CrNiMo17.12.2 – 1.4404

Since it contains molybdenum, stainless steel 316L is able to resist intergranular corrosion. This makes it particularly suitable for the chemical and food industries, the nitrate explosives industry and environments containing halogen (fluorine and chlorine).

Pickling and passivation

A stainless steel surface will have excellent corrosion resistance due to the chromium oxide layer on the surface of the product. With some stainless steels however, the surface areas can become subject to corrosion due to the depletion of chromium during welding, or the introduction of iron during a machining process (not applicable to most cable management products). Where a uniform appearance is important after carrying out welding processes, it is often specified that all surfaces should be pickled and passivated to remove the smoke stain from the welding process. Also where extreme corrosion resistance is called for, this process may help to remove crevice corrosion from around the welding area.

Pickling

The pickling process involves the article being immersed in a blend of acids which dissolve iron and iron oxides which adhere to, or are embedded in, the surface of the stainless steel. These acids cause a removal of the surface layer of between 1 and 3 microns. The article is finally rinsed with water to complete this stage of the process.

Passivation

Passivation of the stainless steel will occur naturally after pickling when the oxygen in the air will react with the surface of the steel to form a passive chromium oxide layer. However it is usual for this passivation process to be speeded up by immersing the article in a nitric acid or other passivating agent.

Untreated

Pickled and passivated

Untreated

Pickled and passivated

Pickling and passivation gives Cablofil stainless steel wire cable tray a very light grey colour and a distinctly matt finish.

All Cablofil stainless steel products are pickled and passivated.

Installation of services

IN THIS SECTION...

Steel wire cable tray systems

1. Design factors to consider
2. Loadings

Steel wire cable tray systems

Cable tray systems are intended for the support of a combination of cables, electrical equipment and/or communication system installations. Where necessary cable tray systems may be used for the segregation of cables.

Note : these systems are designed for use as supports for cables and not as enclosures giving full mechanical protection.

These systems are covered by BS EN 61537.

1 Design factors to consider

Consideration should be given to the following factors when undertaking the design of a support system although some of these (e.g. snow/wind loads) may not be relevant to every installation.

- (i) **Distributed loads (eg. cables, pipes)**
- (ii) **Point loads**
- (iii) **Snow, wind and external forces**
- (iv) **Safety factor**
- (v) **Deflection**
- (vi) **Spacing of supports**
- (vii) **Location of couplers**
- (viii) **Testing of cables within a support system**
- (ix) **Electrical continuity**
- (x) **Earth protection**
- (xi) **Electromagnetic compatibility (EMC)**

The following sections provide a wealth of useful information on each of these design aspects.

(i) Distributed loads

Before commencing the design process for a new installation it is usual to consider whether future changes in the pattern of demand for building services will impose increased loading requirements on the support system. If so, it is good design practice to allow both the physical space and sufficient load carrying capacity for the future addition of 25% more cables or other loading medium.

Estimation of cable loads

If full details of the cabling layout are available then the likely cable load can be calculated using either manufacturer's published information or the tables of cable weights and diameters which are given opposite. However, it is often necessary to select a tray design in the absence of accurate information on the likely cable load. To assist this selection process a useful approach can be to choose a likely size of tray and then to estimate the maximum cable weight which is capable of being contained within it. This estimate may be arrived at using the following guide :

Max. cabling capacity (kg/m) = cable laying area (m²) x 2800

Note : this formula only provides an estimate of the maximum load which can be physically contained within a tray. The ability of that tray to support such a load depends upon the spacing of its supports.

Cable weights and diameters

Tables 1 and 2 below give typical weights and diameters (D) for PVC sheathed, steel wire armoured cables with stranded copper conductors.

Tables 3 and 4 give typical weights and diameters for PVC sheathed, unarmoured stranded copper power cables. Cables with XLPE (cross linked polyethylene) insulation are usually slightly lighter so the information given may also be used for these cables too.

Values show approx. weight and diameter of typical cables.
D = Overall cable diameter.

(ii) Point loads

Point loads may consist of permanent equipment, such as lighting luminaires, junction boxes or other switchgear, or temporary loads such as commissioning equipment or installation personnel, however, consider 'safety during the installation phase'.

Analysis of uniformly distributed loads (UDL), such as cables or pipes is relatively simple but analysing the effect of a point load is quite complex; fortunately a simple alternative approach is available.

Firstly, one makes the reasonable assumption that the point load will be situated in the worst position at mid-span. The force this point load imposes can then be taken as equivalent to that imposed by a load of twice its value uniformly distributed along the span. Thus the point load can be converted to the equivalent uniformly distributed load which is then added to other UDLs to produce one total uniform load.

Example:

Point load = 30 kg

Support spacing = 3 m

UDL = 100 kg/m

UDL equivalent to 30 kg point load =

2 x Point Load = 2 x 30 kg = 60 kg = 20 kg/m

Total UDL = 100 kg/m + 20 kg/m = 120 kg/m

The suitability of a tray to carry this total load can then be considered using the loading graph information (see p. 125).

Although this treatment does assume the point load will be in the 'worst case' position, the installer should, given discretion, always position any point load as close as possible both to a support and to either side flange, minimising the stress on the installation, as per the following illustration.

(iii) Snow, wind and external forces

The loading graphs show the maximum safe working steady load for each type of support system. If the system is outdoors and must also sustain snow, ice, wind or other variable forces these must also be taken into account at the design stage.

Appropriate design data for UK weather conditions is given in British Standard BS EN 1991.

(iv) Safety factor

To arrive at a safe working load (SWL) for each type of equipment Legrand test their products to find the ultimate failure load. The SWL is obtained by dividing the load before failure by a factor of 1.7 minimum.

This safety factor may need to be increased by the designer depending upon the circumstances. For example, if the support system is expected to be subject to aggressive abuse a safety factor as high as three or more may be used. Such treatment is, however, the exception and care should be taken not to over-design the system by using an unnecessarily high safety factor.

(v) Deflection

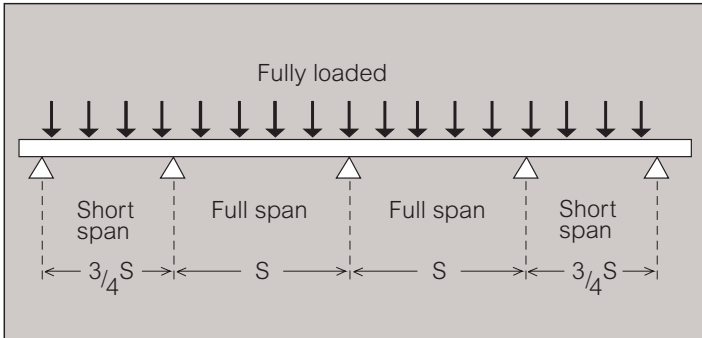

The deflection of a cable tray under load is not directly related to its strength but it is obviously of aesthetic importance. For this reason it may be necessary to estimate the likely deflection whilst designing an installation, especially if it will be in a highly visible location. Experience has shown that in order to maintain a degree of deflection which is subjectively acceptable to the eye, the load on the cable tray will often be restricted to well below its safe maximum.

In the event of critical overload, a steel wire cable tray (wire mesh) structure becomes like a hammock.

(vi) Spacing of supports

Services support installations are usually considered as multi-span arrangements but it is important to recognise that the loading capability of the system is not uniform from end-to-end. The strength of the two end spans in any run is much lower than that of intermediate spans, even when the ends are rigidly fixed. In many situations the end spans will be more lightly loaded anyway; if however they are not and the installation will be fully loaded from end-to-end then it is recommended that the support spacing of both end spans should be reduced to no more than three quarters that of intermediate spans. However it is not a mandatory requirement, but is both useful and advisable.

Sometimes the necessary support spacing may be dictated by the nature of the building fabric. If however the designer has discretion over the spacing of supports the loading graphs can be used to maximise this distance. This will reduce the number of support components and fixings that will be required, thus reducing the overall cost of the installed system.

Supports for cable tray (P2000)

Some of the Cablofil steel wire cable tray loading graphs are denoted as P2000. This means setting supports at 2 metre apart instead of 1.5 metres, thus enabling the installer to reduce, a) the number of supports used and b) the overall installation time.

Example:

Span 1500 : $100 \text{ m} / 1.5 = 67$ supports

Span 2000 : $100 \text{ m} / 2 = 50$ supports

Support of fittings

Cable tray fittings must always be provided with local support. The illustrations opposite give recommended support positions.

(vii) Location of couplers

In practice it is often impossible to predetermine where the couplers will be located within a straight run of cable tray. However it is well worth making some effort to roughly plan their position during the early stages of installation.

The worst positions for the couplers is directly underneath a support.

The best position for joints in a continuous installation is one quarter / one fifth of the span distance on either side of each point of support.

Optimum
 100% PERFORMANCE
 For best results, place the couplers at 1/4 or 1/5 of the way along the span

Possible
 70% PERFORMANCE
 If the coupling is at L/2, a coefficient of 0.7 should be applied to the permissible load

Forbidden
 Never put the support under the coupler

Recommended support locations – steel wire cable tray

Positioning of the supports

Changes of level and direction – put supports in place before there is any deflection of the cable tray route.

It is recommended to place supports at the start and end of 90° bends. A support must be positioned in the middle of large-radius bends.

(viii) Testing of cables within a support system

Short circuits

When an electrical short circuit occurs under fault conditions the current that flows can, in some instances, reach tens of thousands of amps and can last from a few milliseconds to several seconds depending on the electrical installation requirements. Such short circuit currents produce high magnetic fields which can interact to produce large mechanical forces. These forces can cause significant displacement of the cables and therefore some form of restraint must be provided to prevent damage to the cables.

For large diameter cables the most common form of restraint is by the use of cable cleats which hold the cables to the steel wire cable tray. Some force may therefore be transferred to the steel wire cable tray via the cable cleat, and could be sufficient to cause damage to the steel wire cable tray.

The calculation of the forces is complex and the effect on a steel wire cable tray system can only be fully determined by testing.

The main causes of short circuits are as follows :

- Damage to insulating material as a result of wear and tear or mechanical impact
- Broken conductors
- Conducting elements falling onto or otherwise coming into contact with the circuit

Short circuit tests

Tests were performed at a recognised independent laboratory (DAMSTRA) and in accordance to standard EN 50368 (2003) - Cable cleats for electrical installations, in order to validate Cablofil steel wire cable tray's mechanical resistance to the stress generated by a short circuit.

An initial short circuit is generated during the tests, creating mutual electromagnetic repulsion between the power cables.

The cable tray is then subjected to substantial mechanical stress for a very short time (approx. one second). The process is repeated in order to demonstrate that Cablofil steel wire cable tray is structurally intact and able to cope with another short circuit.

As a final measure, additional tests are performed in a damp environment to check whether the cables are fully intact.

The various tests are run with 3 successive levels of short circuit current :

- 70 kA, equivalent to a repulsive force of 1 300 daN
- 100 kA, equivalent to a repulsive force of 2 700 daN
- 130 kA, equivalent to a repulsive force of 4 500 daN

Material used : 3 m length of CF105/450, coupled 1/5 of the way along the span, 5 fast couplers and a support span of 1.5 metres.

System configuration : 3 single conductor power cables, 38 mm in diameter, are attached every 600 mm using cleats.

Before test

During test

After test

Intensity	Class	
	Class 1	Class 2
70 kA	✓	✓
100 kA	✓	✓
130 kA	✓	✓

Conclusion

The tests reveal that the steel wire cable tray shows no permanent deformation - its mesh structure is able to absorb the physical stress generated by a significant short circuit current.

The cables remain intact in their original positions and network availability is maintained.

Reliability and durability

The two major considerations for the network infrastructures are the reliability and durability of the installation. In order to measure the positive contribution made by Cablofil steel wire cable tray, even when overloaded with cables, a series of independent tests were carried out.

• **Independent tests**

The aim was to develop a detailed understanding of the short-term or long-term benefits of using Cablofil steel wire cable tray, as opposed to conventional flat-bottomed supports, for Cat. 5e and Cat. 6 cables. Cablofil steel wire cable tray lengths were tested by Intertek Testing Services, a division of ETL, the world's leading provider of testing, inspection and certification services.

• **Measurements**

For the two tests described below, parameters relating to cable characteristics (NEXT, FEXT, Attenuation Return Loss, etc.) are measured in different configurations. The main parameter selected for comparison purposes is Return Loss. The aim is to define a cable's impedance regularity. Each irregularity causes the signal to return to its source.

• **Test 1 : reliability under load**

90 metres of Cat. 5e and Cat. 6 cables were tested with no load, before being subjected to mechanical stress equivalent to the weight of 40 cables stacked together. Measuring and comparing the Return Loss for each configuration determines the effect of the support.

Results :

The tests show that, for a Category 5e or Category 6 cable subjected to a load of 40 cables, there is no significant difference in behaviour between Cablofil steel wire cable tray and a support with a flat base.

• **Test 2 : durability under load**

In order to establish how data cable installations change over time, the equipment is subjected to a simulated 15 year ageing process based on extremely stringent military standards and the same tests are performed. The cables and supports undergo 200 cycles over large temperature variations (-40°C to +85°C) over a period of 2 weeks.

Results :

The cable supported by Cablofil steel wire cable tray, an open and ventilated system, performs better than a cable laid directly on the floor.

(ix) Electrical continuity

Fundamental to providing safety to people and property, electrical continuity also plays an essential role in the EMC performance of an electrical installation.

Definition

The electrical continuity of a system is its ability to conduct electric current. Each system is characterised by its resistance (R).

If $R = 0 \Omega$, the system is a perfect conductor.

If R is infinite, the system is a perfect insulator.

The lower the system's resistance, the better its electrical continuity will be.

The importance of excellent electrical continuity

Even at the same electrical potential each part of the steel wire cable tray run helps dissipate any fault currents :

Tested for electrical continuity

• **Steel wire cable tray lengths**

Tests show that Cablofil steel wire cable tray lengths more than meet the requirements of the standard IEC 61537, which stipulates that cable tray resistance must not exceed 5 mΩ/m.

• **Steel wire cable tray couplers**

The standard IEC 61537 states that coupler resistance must not exceed 50 mΩ. The test involves running an electric current through the system (lengths + couplers) and measuring coupler resistance.

Test results

An average of 0.82 mΩ for Cablofil couplers. This is between 50 and 80 times better than the requirements given in the standard.

All Cablofil couplers are tested and compliant.

Please contact our technical support team on +44 (0)845 605 5334 for the full results of these tests.

(x) Earth protection

Earthing an installation is vital for the safety of people and property. Furthermore it plays an active role in EMC.

Definition

The earth network is made up of all the metallic components of a building that are interconnected. These include beams, conduits, cable management, the metal frames or devices. All such elements must be interconnected to ensure the earth network is equipotential.

Benefits of equipotential earthing network

The equipotential earth network works like a system of conduits evacuating any fault currents and the parasite currents to earth. This provides a means of :

- protecting people and property
- obtaining a satisfactory EMC performance level

Integrating steel wire cable tray into the earth network

In order to benefit from the advantages in terms of safety and EMC, metallic cable trays must be connected to the earth network every 15 m.

Where tray runs are shorter than 15 m, the ends of each metal cable tray must be connected to earth.

Any electrical circuit thus formed by the cable tray must be closed to help remove any fault or noise currents which may arise.

Role of the protective conductor : The protective conductor provides a simple and effective means of connecting the cable tray to earth.

(xi) Electromagnetic compatibility (EMC)

Understanding EMC involves the analysis of electromagnetic pollution between a source of disturbance and its victim.

Definition

Electromagnetic interference is emitted by a source polluting a victim. Electromagnetic interference is transmitted by a process known as coupling. An EMC problem only occurs when the three elements source, coupling and victim are evident. To obtain a good EMC we simply need to eliminate one of the three elements or reduce its effect.

Metallic cable trays with excellent electrical continuity, which are integrated into an installation's equipotential earthing network, reduce the effects of coupling and therefore improve an electrical installation's EMC.

The solution offered by Cablofil steel wire cable tray

- Its open structure makes it easy to ensure correct separation by visual inspection
- Its easy installation and metal structure guarantee excellent electrical continuity in all cases : couplings, bends, changes of level, crossovers etc.
- Its open structure can reduce 'cross talk'

EMC tests

Tests conducted by the accredited and independent AEMC Measures and CETIM laboratories demonstrate the performance of Cablofil steel wire cable tray in relation to the EMC of the electrical installation.

The golden rules!

Remember the importance of keeping power and data cables separate.¹
(EN 50174-2 standard)

Make sure different cable types cross at right angles.

Make sure electrical continuity is preserved : use metal cable tray and couplers.

Connect cable trays to the earthing network (every 15-20 m).

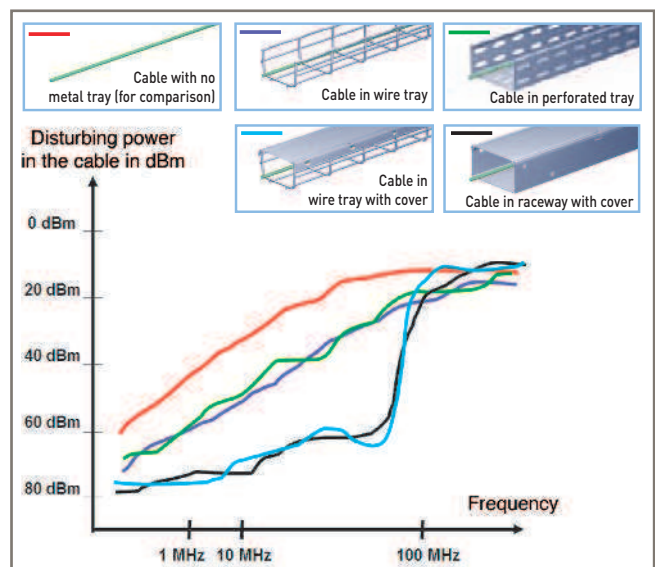

¹ : The EN 50174-2 standard specifies how far cables must be kept apart. This depends on the type of data cable, the number of power cables and the type of cable tray. Otherwise, the distance of 20 cm provides a simple and sensible rule of thumb. For precise details, please contact our technical support team on +44 (0) 845 605 5334.

• Test 1 - configuration:

Data cable in an external electromagnetic field

A data cable (Category 5e UTP) is placed in an insulated anechoic chamber and subjected to a powerful artificially-generated electromagnetic field in order to simulate electromagnetic interference.

Each tray is connected to earth and subjected to the test :

Results and interpretations

A simple comparison of the measurements for the different cable tray configurations - steel wire cable tray (wire mesh) and perforated cable tray, with and without cover - makes it possible to quantify the role played by cable tray in relation to EMC.

These tests show that there is no significant difference in 'Faraday cage' effect offered by steel wire cable tray (wire mesh) or perforated cable tray.

These results show that it is vital :

- to use metal cable tray
- to earth the cable tray
- to use a cover if required

• Test 2 - configuration:

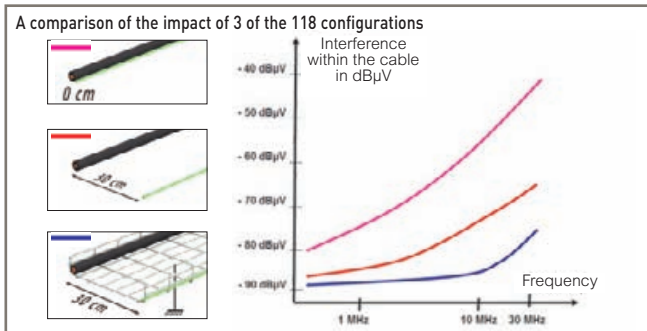

Data cable alongside a power cable

A Category 6 UTP data cable is placed inside an insulated anechoic chamber and subjected to an electromagnetic field generated by a power cable.

The following parameters are studied :

- Cable tray earthing
- Separation distances - 0, 10, 20, 30 cm
- Cable tray type - steel wire cable tray (wire mesh), perforated cable tray, trunking
- Separated cable trays
- One cable trays, with and without dividers

As a result, a total of 118 configurations are tested.

Results and interpretations

This second test configuration confirms that metal cable trays reduce interference - steel wire cable tray (wire mesh) and perforated cable tray.

To obtain a good EMC, these results show that it is vital :

- To use metal cable tray
- To earth the cable tray

2 Loadings

First and foremost, steel wire cable tray must act as an effective, resistant and durable support for cables.

The mechanical performance of all products and accessories is tested against the very demanding requirements imposed by the international standard IEC 61537.

i) Safe working loads

The permissible load stated in this catalogue represents the load that Cablofil steel wire cable tray is guaranteed to be able to bear. It assumes loads are evenly spread and is given in daN/m. The standard permits a deflection equivalent to 1/100th of the span. Legrand imposes a stricter limit of 1/200th for both safety and aesthetic reasons. For example, Legrand voluntarily restricts deflection to 10 mm for a span of 2 m, whereas the standard would allow 20 mm.

Load tests carried out to IEC 61537 (safety factor 1.7 + joint 1/5th of the way along the span). Permissible load should include all cable loads and any other additional loads (eg: wind, snow).

(ii) Safe working loads for supports

Brackets are classified by their permissible load (in daN).

Hangers are classified by their permissible torque (in daN/m).

All Cablofil supports are tested and comply with the IEC 61537 standard.

F - is the load (in daN) applied to the support.

d - is the distance between the hanger axis and the load.

T - is the torque (in daN/m) applied to the hanger.

Calculation rules :

Total F = F₁ + F₂ + F₃ ← permissible hanger load

Total T = F₁.d₁ + F₃.d₃ - F₂.d₂ ← permissible hanger torque

(iii) Load tests : test configuration according to standard IEC 61537

Each Cablofil steel wire cable tray has been tested in the required configuration, with a coupling 1/5th of the way along the span. Deflection is measured at the centre of the span.

The values given in this document have been obtained from extensive testing of our cable support equipment. They are given as a guide, so that customers may use Legrand's products to the best advantage; they are nevertheless average figures which are given in good faith, but without accepting any liability in contract, tort or otherwise in the event of different performance by equipment which is actually supplied.

Fire resistance and protection

IN THIS SECTION...

Fire resistance

1. Standard DIN 4102-12
2. Recognised independent laboratories
3. Test configuration
4. Samples of configurations tested

Fire resistance

Safety is a major concern for everyone, but can only be achieved with knowledge of how electrical equipment behaves in the event of a fire. Cablofil steel wire cable tray has been successfully tested and proven to meet all fire safety requirements.

1 Standard DIN 4102-12

The German DIN standard serves as a reference. As there is no European standard on fire resistance specifically for cable trays. The German standard specifies that the entire system of cable trays, accessories and cables must be tested in an oven which is at least 3 m long for a period of 30, 60 or 90 minutes at temperatures of up to 1000°C.

Period	Certification
→ 30 minutes	E 30
→ 60 minutes	E 60
→ 90 minutes	E 90

The test aims to verify whether the electrical system is working properly and make sure that sources of critical data (emergency lighting, ventilators, emergency exit, fire alarm, etc.) can resist long enough to provide assistance in the event of a fire.

2 Recognised independent laboratories

The IBMB (Institut für Baustoffe, Massivbau & Brandschutz) and FIRES laboratories are recognised centres for testing and issuing the associated certificates. They ensure that the test conditions described in the standard DIN 4102-12 are observed.

3 Test configuration

Cablofil steel wire cable tray standard products passed the tests without the need to develop an extensive or specific range. The configurations used by Legrand involve wire cable trays with two different spans (1 250 mm and 1 500 mm) subject to a maximum permissible load of between 2 kg/m and 20 kg/m. The increase in temperature follows the temperature curve (ETK) defined by DIN 4102-12.

The E 90 test does not in itself validate a wire cable tray, but validates the combination of Cablofil steel wire cable tray with a specific type of cable. This underlines the complexity, as well as the relevance, of these tests, which have already been passed by a number of cable types. Cables are tested in pairs.

The surprising appearance of the cable tray after the test is quite normal. The mechanical properties of the cables and cable tray are impaired but they achieved their objective; to ensure the durability of the installation for a given period.

Before test

During test

After test

4 Samples of configurations tested

Cablofil steel wire cable tray is certified to E 90 for a number of configurations that meet the requirements of data transfer facilities designed to ensure the protection of property and people in the event of a fire.

Below are 9 representative samples of the more than 20 configurations tested.

Light duty
