Advanced LED Lighting

# Part of the Leviton® family

## About Leviton®

Leviton is a world leader in diversified electrical technologies and the largest privately owned manufacturer of electrical wiring equipment in North America.

Leviton products help customers create sustainable and intelligent environments through their electrical wiring devices, network and data centre connectivity solutions, lighting energy management systems, and security and automation applications.

Operating in over 80 countries and with a portfolio of more than 25,000 products, Leviton are at the forefront of global developments in building technology and are uniquely positioned to support JCC in developing cutting edge LED innovation.

Leviton acquired JCC in 2013 to enhance JCC's position as the UK market leader in LED lighting and strengthen our shared vision to ensure accessibility to the benefits of the latest LED technology.

---

## About JCC®

Established in 1989, JCC are market leaders in the development of cutting edge LED lighting technology.

We are driven by our passion to create innovative LED lighting solutions. This ensures that our customers can take advantage of the benefits that the latest LED technology can provide for both domestic, commercial and industrial applications.

We believe that LED lighting is the most effective way that homes and businesses can tackle rising energy costs and the global need to reduce CO<sub>2</sub> consumption.

LED technology provides us with the opportunity to readdress traditional lighting and create innovative solutions that can improve installation times, enrich our homes, increase productivity within the workplace and enhance safety across all environments.

# Catalogue 30

---

We are driven by a passion to create innovative LED lighting solutions. With 16 new ranges and many additions to our most popular products, the 30th edition of our catalogue continues our passion and commitment to deliver the very latest in LED innovation.

We maintain leadership in key product categories by delivering cutting edge product innovation to the market. Our aim is to provide unique lighting solutions that resolve key issues for electrical contractors, whilst ensuring that end users are provided with the highest level of performance and reliability.

Our commitment to excellence extends throughout everything we do, from product design to after sales support. We are proud to have a respected UK based customer service and technical support team that provide the very best in personal assistance to all of our customers.

# Independently tested for complete assurance

## OUR INDEPENDENT TESTING HOUSES PROVIDE CERTIFICATION OF LIGHT OUTPUT, POWER CONSUMPTION, SAFETY FEATURES AND PRODUCT LIFE

Being Britain's most loved LED lighting brand, we understand the importance of providing proven and tested technology to our customers. Independent testing has been a core part of our product development process for 25 years and underlines our key brand promise to deliver proven LED safety and innovation to our customers.

For us, quality is more than simply a word, it forms the basis of our entire brand and drives our passion for producing market leading LED technology.

### ✓ IN-HOUSE TEST FACILITIES

In addition to our independent test houses, we have developed an advanced lighting design and test facility at our headquarters in West Sussex.

Our state-of-the-art facility provides us with precise information on the colour, quality and performance levels of our products.

### ✓ WE STATE DELIVERED LUMENS

We are committed to providing honest and accurate information. When we state the light output (lumens) – we have tested the total fitting and measured the actual light output including any light transmitter, diffuser or optics. Beware of products that just quote the initial lumens from the LEDs.

## Industry leading warranties

### COMPLETE ASSURANCE OF QUALITY AND RELIABILITY

We believe that a manufacturers' warranty is your assurance of quality and reliability. This is why all of our products are covered as standard by our two year product guarantee. In addition, select products are also covered by our five, seven or ten year extended warranties.

### REGISTER YOUR PRODUCT ONLINE

Simply go to [jcc.co.uk/warranty](http://jcc.co.uk/warranty) and enter your product details.

# Designed for consistent quality & performance

## MAXIMISING CONSISTENCY ACROSS ALL OUR RANGES

All of our products have been specifically designed to ensure they compliment one another and provide complete consistency throughout the application.

### CONSISTENT QUALITY & PERFORMANCE

Using the latest developments in LED technology and high specification componentry, we ensure excellent continuity between lighting solutions.

### CONSISTENT LOOK & FEEL

Our products have been designed to compliment one another with matching finishes and construction techniques.

### CONSISTENT COLOUR TEMPERATURES

We align the colour temperature of our fixtures to suit their applications and ensure a unified lighting style.

### CONSISTENTLY HIGH LEVELS OF CRI

Our products are designed to accurately display products and provide consistently high levels of CRI, typically exceeding 80+.

### EMERGENCY VERSIONS

For complete peace of mind during emergency situations, our new LED fittings feature fully integrated emergency solutions.

### LIGHT UNIFORMITY

Our products are all engineered to provide smooth, crisp and even light distribution, reducing dark areas and shadowing.

## Calculate your own cost savings

### AVAILABLE FROM THE APP STORE AND GOOGLE PLAY STORE

The app allows you to see the exact energy and maintenance savings that our market leading LED products can provide to your home or business.

### DOWNLOAD OUR FREE COST SAVING CALCULATOR APP

Get a precise energy reduction and cost saving calculation for your application based on your current energy and light fittings.

# Easily upgrade at end of life

Unlike traditional integrated fixtures, Hybrid™ products can be changed as easily as a lamp. The LED module and bezel combination encapsulates all of the technology into a single unit, delivering all of the benefits of a true integrated fixture with the flexibility of a lamp.

- ✓ Easily replaced by end user
- ✓ Simple to adapt if room use changes
- ✓ High quality integrated styling
- ✓ Enhanced thermal management
- ✓ Greater performance and product life

# Simple to remove during decorating

Painting ceilings is made easy by simply removing the front of the fitting. This avoids getting paint onto the fixture during redecorating and makes painting far quicker.

- ✓ No paint on bezels
- ✓ No damaged or scratched bezels
- ✓ No masking bezels off to paint

# Change fittings with ease

In contrast to traditional integrated fixtures, Hybrid™ products provide complete flexibility to change the finish or colour temperature of the fixture as desired. All Hybrid™ products are available in brushed nickel, chrome and white finishes with both 3000K warm white and 4000K cool white options.

## Technology in your hands

In contrast to traditional integrated fixtures, Hybrid™ products have been designed to incorporate all of the LED technology within the combined module and bezel. This ensures that customers have complete control of their lighting and the ability to adapt, upgrade or replace at the end of the products' life with ease.

### HONEYCOMB LENS TECHNOLOGY

Hybrid™ uses our unique honeycomb lens technology that provides smooth and even light distribution.

### LED MODULE

Hybrid™ LED modules use the latest driverless technology from leading LED chip manufacturer Seoul Semiconductor.

SEOUL SEMICONDUCTOR

### ULTRA SECURE CEILING CLIPS

Once installed, the strong adjustable clips ensure no movement within the ceiling.

### ENCLOSED CAN

Provides maximum fire safety and protects the heat sink from dust and debris.

### HIGH QUALITY DIE-CAST METAL BEZEL

Bezel comes complete with LED module and is available in brushed nickel, chrome and white finishes.

### LEVLINK™

Hybrid9™ comes complete with our innovative LevLink™ 6 way connector. See pages 16 & 17

# LevLink™

## The ultra fast tool-less wiring system

### First fix

LevLink™ has been designed to allow for first fix installation. This allows testing of the circuit to be carried out prior to the installation of the fitting, minimising the risk of damage. The secure cable restraint ensures complete peace of mind during installation.

### No tools required

LevLink™ uses push-fit termination which, unlike traditional screw-fit terminals, requires no tools for installation. Simply align the L,E,N wires with the respective terminals and the PCB reconfigures without the need to overlay separate wires into single terminal points. This dramatically reduces time and improves ease of installation.

✓ **LEVLINK™ PUSH FIT CONNECTOR**

✗ **TRADITIONAL SCREW FIT CONNECTOR**

### Ultra fast push-fit termination

**WIDE ACCESS & LARGE TERMINAL BUTTONS**

LevLink™ allows for wide access to the terminals, as well as large buttons.

**ACCEPTS SOLID & STRANDED CABLE**

LevLink™ has been designed to accommodate both solid and stranded cable types.

### 9 Way connector & T-splitter

**SIGNIFICANTLY FASTER SWITCH LIVE WIRING**

The LevLink™ 9-way connector used in conjunction with the T-splitter dramatically reduces the speed of first fix switch live wiring. In addition, this also enables installers to replace existing ceiling rose wiring.

# LevLink™

## Ultra fast tool-less wiring system

- Plug & play press-fit design
- Wide access to large terminal buttons
- Accept both solid and stranded cables
- 9-Way and T-Splitter to incorporate switch live wiring schemes
- Loop-in loop-out screwless wiring

## Provides a new fascia to existing downlights

Our Hybrid7™ Overbezel allows you to fit a new LED module into an existing JCC Fireguard® twist & lock can. The bezel has been specifically designed to discretely cover the existing fixed bezel attached to the can.

This provides a full new front fascia for older fittings while still maintaining the look of an integrated LED downlight. Furthermore, fire safety is maintained for complete peace of mind.

## Installation couldn't be easier

### STEP 1

Take the Hybrid7™ Overbezel fitting and connect it to the JCC Fireguard® Standard Twist & Lock can's GU10 connector.

### STEP 2

Place the Hybrid7™ Overbezel fitting into the can until the bezel is flush with the ceiling.

### STEP 3

Rotate the bezel until it locks firmly into the can and is tightly secured against the ceiling.

Hybrid7™ Overbezel has been specifically designed for use with JCC Standard Fireguard® Twist & Lock fire-rated fittings only. For more information on compatible JCC product codes, please go to [jcc.co.uk/Hybrid7\\_Overbezel](http://jcc.co.uk/Hybrid7_Overbezel)

## Darklight bezel for low glare installations

The anti-glare baffle design across the JCC range of 8W, 12W and 15W downlights, make them more suitable to applications which require low glare lighting.

## 35° tilt for sloped ceilings & directional lighting

Tiltable as standard to 35°, ensures that the Nebula™ Darklight range is a versatile downlight for use in highlighting and directional lighting.

Use on horizontal ceilings to direct light and wall wash.

Use on sloped ceilings to provide vertical downlight.

# LED Panels

# Introducing Skytile<sup>®</sup> Sense

Skytile panel with integrated daylight harvesting  
or microwave presence detection

## Microwave presence detection

Presence detectors ensure that areas are only lit when occupied and are therefore one of the best ways to significantly reduce running costs.

Skytile Sense integrated driver technology uses microwaves to detect presence through the back of the LED panel controlling the LED panel when occupancy is detected.

When presence is no longer detected, the panel will automatically dim down and depending on settings pre-selected by the user; the panel will stay at a low light level or switch off fully.

To ensure sensor technology is integrated seamlessly into the workplace environment, the panels can be wired in banks so that the panels are synchronised with one another.

### Variable detection diameter

- Wide and narrow detection area
- Suitable for office and corridor applications

### Integrated sensor technology

- Combined LED driver and microwave sensor
- Single point installation, no commissioning required

### Microwave presence detection

- Step dimming from 10-50%
- Variable hold time and standby period

### Group wiring

- Fittings wired in synchronised banks
- Seamless workplace integration

Up to  
**60%**  
Additional energy saving

Integrated  
sensor driver

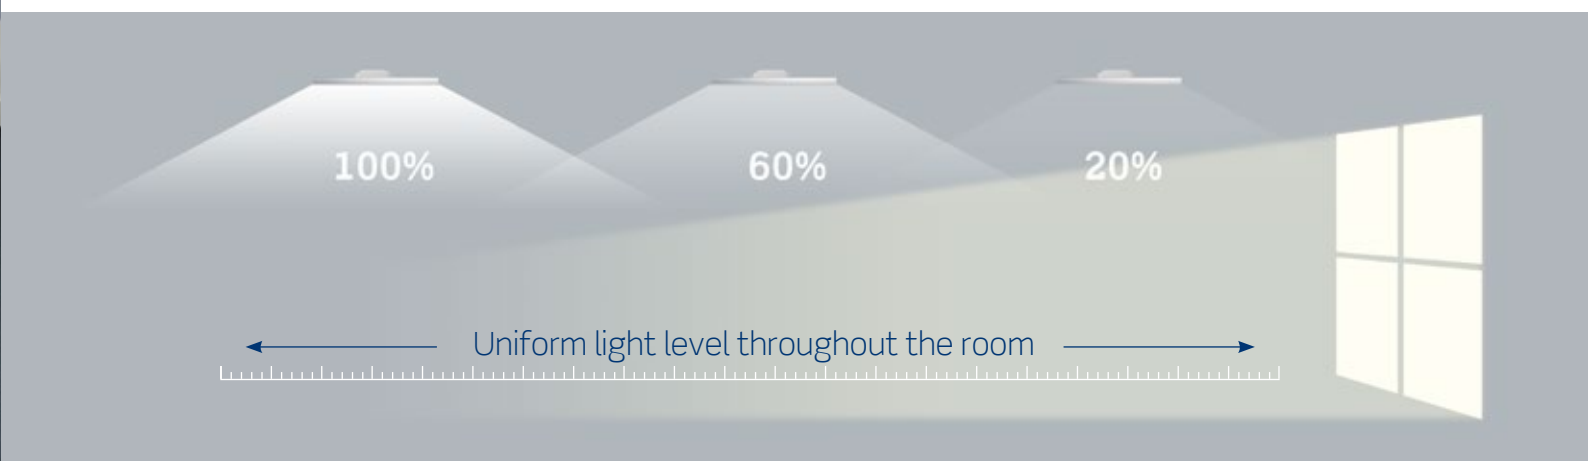

Simple one point  
installation

## Daylight harvesting

Maintaining optimal light level without over lighting the workspace environment is a fantastically simple way of making further energy and cost savings. The integrated light sensor within the Skytile LED driver which sits on the back of each LED panel has been engineered to continuously detect and monitor ambient daylight within the work space environment.

Throughout the day, Skytile will automatically dim and brighten in order to balance LED light with natural light fluctuations through nearby windows, to meet the target LUX level that has been pre-set by the user adjusting the dip switches on the driver.

### Target ambient lux levels

- Simple initial dipswitch setup
- Preset levels from 150-500 lux

### Responsive dimming

- Intelligently adapts to fluctuations in natural daylight
- Significant reductions in running costs

### Integrated driver technology

- Combined driver with photocell
- Automatic daylight sensing through panel face

### Single point installation

- Quick and simple point retrofit solution for 4x18W T8
- No need for additional wiring or sensors

LUMENS

## POLYCARBONATE LIGHT DIFFUSER

The polycarbonate diffuser provides an even light distribution to the room and will not drip hot plastic in the event of a fire, providing extra safety assurance in the workplace.

## INNOVATIVE LIGHT TRANSMITTER

The surface properties of the light transmitter ensure light moves evenly throughout the fitting. The light pixels covered base directs all the light into the polycarbonate diffuser.

## LIGHT REFLECTOR

The high quality mild steel light reflector ensures that all light is reflected back into the light transmitter.

## ANTI-TAMPER DESIGN

The LED panel is secured into place by two locking clips on the end of the fitting.

## HIGH PERFORMANCE LED CHIPS

Light is projected from the high specification LED chips directly into the light transmitter. Skytile<sup>®</sup> LED technology provides maximum light with minimum energy consumption.

## Designed for quick and easy installation

**1** The LED panel is placed into the base.

**2** The LED panel is then moved across the base on the internal runners.

**3** The LED panel is then pushed back up into the base.

**4** The LED panel is secured from both sides with sliding clips.

WARRANTY

**PRESSED ALUMINIUM CONSTRUCTION**

Skypack® is lightweight and easy to handle Providing maximum strength and durability.

**IMPACT RESISTANT DIFFUSER**

The polycarbonate diffuser, eliminates the risk of shattering lamps.

**CAPTIVE SCREW**

Captive screw firmly secures the LED tray to the base for security.

**END CAP**

Discretely covers the captive screw for a seamless finish

**DESIGNED FOR PERFECT LIGHT UNIFORMITY**

The position of the LED chips within Skypack® have been specifically designed to ensure that their 120° beam angle adequately merges and eliminates the dark striping that can often be seen on poorer quality LED battens.

## Unique slide & lock design for ultra fast installation

Skypack® features a unique slide and lock mechanism, a plug and play DC connector and press fit termination for quick and easy installation compared to traditional fluorescent and other LED battens. This ensures installation time is minimised and downtime reduced.

1

Remove the LED tray from the base using the slide and lock mechanism and fix the base to the ceiling.

2

Reattach the tray to the base by aligning the hinge holes. Allow the LED tray to hang and reconnect the plug and play DC connector.

3

Rotate the LED tray back up into position, slide into place and secure using the captive screw.

## High quality construction

### WIRING ENTRY POINT

Entry points are located on the back and ends of ToughLED™.

### HIGH SPECIFICATION LED ARRAY

Using a linear LED configuration, ToughLED™ provides crisp, clean light with a cool 4000K colour temperature, designed to make areas appear brighter and provide a sense of security.

### ONE PIECE INNER DIFFUSER

As part of the dual diffuser system, the thin inner diffuser removes any harsh glare from the LED chips that could be hazardous in industrial environments.

### STAINLESS STEEL ANTI-TAMPER CLIPS

Stainless steel clips ensure that the diffuser remains connected during installation, avoiding damage.

### POLYCARBONATE CONSTRUCTION

Corrosion and impact resistant base and diffuser for durable, maintenance free operation.

## Multiple wiring options

Conduit entry at both ends, provides three connection points allowing for various installation options.

## Unique strap

The unique strap connects the back to the body, ensuring easy installation.

## INTELLIGENT THERMAL MANAGEMENT

Toughbay's fully integrated heat sink is designed to specifically improve airflow and maximise heat dissipation to help reduce the operating temperature of the fitting and improve reliability.

## MOUNTING LOOP

Comes fixed as standard for quick and easy installation.

## MOUNTING BRACKET

Toughbay's unique mounting bracket is fully adjustable making it versatile and the perfect retrofit solution.

## TRIPLE-ARRAY LED CHIPS

Toughbay™ Linear uses the latest high output LED chips, providing up to 100 LpcW. The triple array is designed to provide even light distribution.

## IMPACT RESISTANT

### POLYCARBONATE LED DIFFUSER

Toughbay™ Linear's high quality polycarbonate diffuser is shatter proof providing extra safety in the work place.

## REFLECTOR

Toughbay™ Linear's high quality reflector ensures that light is evenly distributed, providing a crisp clear light. This makes it ideal for task lighting and areas that require fine detail.

# Toughbay Linear

Outperforms traditional 4x80W T5 fluorescent

**5 year**  
Extended warranty\*

**Microwave Sensor**  
See page 235

**Dimmable**  
1-10V as standard

**Emergency**  
Version available

- Equivalent light output to 4x80W T5 fluorescent
- Up to 40% energy saving
- Consistent Toughbay™ construction and colour temperature
- 95 lumens per circuit Watt
- 110° beam angle
- 50,000 hours life to L70
- Leviton microwave sensing available for further energy savings (page 235)
- IP65, suitable for all industrial applications
- Suitable for production and manufacturing low bay applications
- Suitable for cold storage areas and freezers
- Supplied with two mounting rings and IP67 connector as standard
- Adjustable mounting points for easy installation
- **NEW** available in emergency

## Multi-function sensor

- ✓ Microwave on/off sensing
- ✓ Step dimming
- ✓ Compatible with all Toughbay™ products
- ✓ Wide detection range for precision control

## Wide detection range for precision control

### Up to 15m mount height

The Leviton® multi-function sensor is suitable for mounting heights up to 15m making it the ideal solution for retail and industrial applications.

### 16m wide detection range

The ultra-wide 16m detection range allows installers to control specific high footfall and low footfall areas using both on/off and step dimming sensing. The detection range can be adjusted up to 50% by using the dip switches.

## Designed for simple, versatile installation

### Reflector clip

The Leviton® multi-function sensor comes with additional connector for installation on all Toughbay™ reflectors.

### Direct connector

The Leviton® multi-function sensor can be connected directly to both Toughbay™ Circular and Linear fittings.

### Remote sensing

To provide complete control the Leviton® multi-function sensor can be installed remotely at specified locations.

# Reduce your energy use by a further 50%

## Unlike HID, LED is perfectly suited for use with controls

HID metal halide lamps typically require a 15 minute cool down period when switched off before re-strike, making them unsuitable for use with energy saving occupancy sensors. Whilst fluorescent lamps can be switched on and off, the frequent on/off switching will reduce lamp life by up to 75%, leading to significant maintenance costs.

LED is not only twice as efficient as traditional light sources, but when used in conjunction with microwave sensing can reduce energy consumption by a further 48%. Furthermore, Toughbay™ Sensor is 1-10V dimmable as standard so whether you are looking to implement dimming control now or in the future, significant running cost savings can be achieved at any time.

### On/off sensing

- Without occupancy the lights remain off
- Adjustable hold time from 5 secs - 30 minutes

On/off sensing can be the most effective way to maximise energy savings for areas that are infrequently used and require lights off when there is no occupancy.

This makes on/off sensing the most suitable control solution to use in low footfall areas such as storage areas and loading bays.

### Step dimming

- Without occupancy the lights dim to 10% - 50% of full illumination
- Adjustable standby dimming time from 5 secs - 60 minutes

For higher occupancy areas, such as high rack applications, there may be little or no external lighting contributing to the lighting levels. Having the lights off may compromise the safety to employees if there are unexpected obstacles along the dark aisles.

Retaining a low level of lighting when there is no occupancy increases visibility into areas that are not in use and increases awareness of obstacles or potentially dangerous hazards.

When combining Toughbay™ 230W with occupancy on/off sensing, an astonishing 75% energy savings can be achieved against 400W HID without compromising safety in the workplace.

### CONDUIT ENTRY POINTS

The polycarbonate base for RadiaLED<sup>®</sup> has been specifically designed with side and rear conduit entry points into the base and help maintain the units' IP rating.

### ANTI-TAMPER

The anti-tamper added security screw on RadiaLED<sup>®</sup> Optimum ensures peace of mind. Simply twist and lock the diffuser into place and then secure screw in fitting.

### MICROWAVE SENSING

Microwave on/off and step dimming variants are available for RadiaLED<sup>®</sup> Optimum, which offers additional energy and cost savings.

## BASE

The RadiaLED® polycarbonate base has been specifically designed to accommodate the JCC emergency unit.

## LIGHT REFLECTOR PANEL

The radial reflector ensures that the light is distributed evenly across the fitting.

## DURABLE POLYCARBONATE DIFFUSER

Our RadiaLED® products come with the highest quality polycarbonate diffusers for maximum durability.

## HEAT SINK

RadiaLED® Utility's specially engineered aluminium heat sink effectively draws heat away from the LED chips and helps prolong the life of the fitting.

## RADIAL LED ARRAY

The unique LED array creates even light transmission and avoids any unsightly 2D lamps or hotspots.

✓ Even light distribution

✗ No LED hotspots

✗ No unsightly 2D lamp

The light emitted from RadiaLED®, spreads evenly across the reflector before being dispersed smoothly through the polycarbonate diffuser, giving a completely uniform light transmission.

## The practical solution to the issues of 2D

### LONG LIFE

The life of traditional 2D lamps is shortened by continuous switching on and off. The 30,000 hour life of RadiaLED® is not affected by frequent switching.

### EMERGENCY

RadiaLED® products have been specifically designed to accommodate the JCC emergency unit.

### INSTANT START-UP

RadiaLED® produces light as soon as it's switched on. Traditional 2D lamps have a much lower start-up time and will ultimately fail with frequent switching.

### MICROWAVE

For optimum energy saving, RadiaLED® is available with an integral microwave sensor. Activated by both movement and daylight, RadiaLED® remains on only when required, switching off or dimming when the room is unoccupied or when daylight increases.

## Stylish design

With RadiaLED® Vogue's decorative chrome and white rims, it makes it the ideal fitting to illuminate corridors, stairwells and other amenity areas.

✓ Even light distribution

✗ No unsightly 2D lamp

✗ No LED hotspots

## Backlit halo illumination

RadiaLED® Vogue's back illuminated feature emits a halo of light behind the rim, which allows you to accent walls with soft pools of light.

### EYELID ACCESSORIES

Codes - JC23016/17

### SILVER ACCESSORIES

Codes - JC23018/19

### CHROME ACCESSORY

Code - JC23019

### Two depths

Eyelid and silver accessories are available in shallow and deep sizes

Shallow rims allow for use with conduit entry points

## The practical solution to the issues of 2D

### LONG LIFE

The life of traditional 2D lamps is shortened by continuous on and off switching. The 30,000 hour life of RadiaLED® is not affected by switching frequently.

### INSTANT START-UP

RadiaLED® produces light as soon as it's switched on. Traditional 2D lamps have a much longer start-up time and will ultimately fail with frequent switching.

### EMERGENCY

RadiaLED® products have been specifically designed to accommodate the JCC emergency unit.

### MICROWAVE

For optimum energy saving, RadiaLED® products are available with an integral microwave sensor. Activated by both movement and daylight.

LUMENS

## MATCHING FITTINGS

The NiteLED™ range offers matching bollards, wall lights and ground lights, whilst offering matching colour temperatures and finishes.

## INSTANT START-UP

NiteLED™ produces light as soon as it's switched on. Traditional lamps have a much slower startup time and will ultimately fail with frequent switching.

## ALL WEATHER PROTECTION

The supreme quality of the NiteLED™ range is shown through a minimum IP44 rating, which provides excellent protection against dust and moisture, combined with a high quality paint finish.

## PERFORMS WELL AT LOW TEMPERATURES

NiteLED™ starts instantly even in the coldest conditions. The life of many traditional lamps are not only shortened by low temperatures but the start-up time is also increased.

## DURABLE CONSTRUCTION

The NiteLED™ range has been designed using high quality die cast aluminium and marine grade, low carbon stainless steel in order to minimise corrosion and extend product life.

## SENSOR COMPATIBLE

Suitable for connection to PIR, microwave sensors or photocells.

## Strong, even light distribution

Skyblade's patented design uses Light Guide Board technology to throw the light on to the wall, the work surface and even further down the counter. Alongside one another, the beams from Skyblade® seamlessly blend into one, avoiding 'pools' of light and shadows that other light sources and even some LED fixtures create. All of this creates a clean, consistent level of light across the surface that not only enhances the appearance of any kitchen, but is also perfect for preparation areas.

## Why PIR is more suitable than microwave for domestic floodlighting

### PIR

- Complete control over detection area
- Great for targeted areas
- Suitable for walkways, driveways and doors

### Microwave

- General movement detection leads to false triggering (such as leaves, wildlife & litter)
- 360° detection makes sensing more difficult to control
- Ability to sense through walls further increases unnecessary triggering

### PIR 8m detection range

- Adjustable hold time (5 secs – 8 mins)
- Built in daylight sensor with adjustable lux level
- 8m range when mounted at 2m
- 120° field of detection
- IP44 PIR protection

## Wide symmetrical light distribution

NiteLED<sup>TM</sup> round top and flat top bollards diffuse light wide and symmetrically, using the internal LED cone reflector. This makes it ideal for walkways, car parks & residential applications

## High 60% energy saving against 42W GLS

The high performance LED modules in NiteLED<sup>TM</sup> bollards eliminates maintenance and significantly reduces energy consumption.

# Step Dimming Sensor

1-10V step dimming microwave sensor

- Step dimming microwave sensor (1-10V dimming function)
- Hold time 10 seconds to 30 minutes
- Step dimming level control from 10% to 50%
- Integral photocell for daylight sensor
- Detection area up to 8m mounting height

✓ LEV71910

## How step dimming works

Ideal for corridors, aisles and walkways

### Standby dimming level

Lights run at lower output until movement is detected and can be set from 10% - 50% of full illumination level.

### Occupancy detected

Upon detection of occupancy, lighting increases to full illumination.

### Returns to standby level

Hold time can be adjusted from 10 seconds to 30 minutes after detection. Lighting levels return to standby dimming level to ensure maximum energy saving.

## Daylight harvesting LED panel

NEW  
PRODUCT

Available Nov '16

**7 year**  
Extended warranty\*

**Daylight**  
Harvesting

**Skytile® Range**  
See pages 68-79

- Skytile panel automatically adapts to fluctuations in natural daylight to achieve target LUX level
- Target LUX level is pre-set by installer using DIP switches on driver
- Outstanding energy savings and reductions in running costs
- Simple installation, no need for additional wiring or commissioning
- Achieve up to 60% energy saving

Illuminance of fittings reduces to reflect levels of natural daylight within the room. Fixtures that are closer to windows reduce to save additional energy where full illuminance is not required.

JC93008	Firecage	200mm	400mm	250mm
JC93009	Firecage	200mm	650mm	650mm

FINISH  
White

## CONSTRUCTION

Body - Intumescent material

Luminaire covers required when installing into a fire break ceiling. Offers protection to combustible ceiling void materials. Also provides acoustic damping properties.

Firehoods are flexible and can be fitted from below the ceiling.

BS476: Part 21: 1987

## FIREHOOD CLEARANCE

Overall Width + 100mm minimum  
Overall Height + 25mm minimum

In this instance, the nearest Firehood size (allowing clearance) is JC93001 180mm dia x 150mm height.  
If and when necessary, use a larger Firehood. Clearances are minimum sizes.

## Loft Braces

- Aids the safe installation of recessed luminaires in cold loft areas

### Market Requirements

The use of continuous mineral wool insulating materials makes it difficult to see where downlights have been installed and there is a risk that householders might step or place items of storage on top of the luminaire.

### The solution

The JCC loft brace offers mechanical protection preventing accidental damage to the luminaire as well as the added benefit of additional air movement around the light fitting. Two sizes of brace are offered to span between 400mm and 600mm joist widths and are simply fitted over areas in a loft where a light fitting is present. This simple and economical solution is designed to offer mechanical protection over the luminaire allowing all building and lighting standards to be met.

CODE	DESCRIPTION
JC94020	Loft-brace for 400mm joist spacing
JC94021	Loft-brace for 600mm joist spacing

---

# Technical

# Lighting explained

## A GUIDE TO COMMONLY USED TERMS WITHIN LIGHTING

For full information on understanding lighting performance, visit [jcc.co.uk/lighting-explained](http://jcc.co.uk/lighting-explained)

1

### WATTAGE (VA)

A measure of the energy consumed by a fitting

A measure of power or the rate of energy consumption by an electrical device when it is in operation, calculated by multiplying the voltage at which an appliance operates by the current it draws (Watts = Volts X Amperes).

2

### LUMENS

A measure of light output

A lumen is a unit of measurement that is used to express how much illumination a source of light provides.

3

### LIGHT OUTPUT RATIO (LOR)

The proportion of light that finally leaves the light fitting

This is a measure of the efficiency of the fitting and is a ratio of the lumens leaving the light source and the lumens that finally leave the fitting.

4

### LUMENS PER CIRCUIT WATT (LPCW)

The efficiency of the fitting

A calculation of the efficiency of a fitting. Lumens (3000) ÷ Wattage (50W) = 60 LpcW

5

### LUX

A measure of light intensity

A measure of the intensity of light as seen by the human eye and measured by luminous flux per unit area. One lux is equal to one lumen per square metre.

COLOUR RENDERING INDEX (CRI)

The quality of light

A measure of the ability of a light source to reproduce the colours of various objects. A light source with a CRI of 100 (Ra) would be perfect and balanced in terms of colour reproduction, shading and contrast.

LUMEN DEPRECIATION (L70)

The deterioration in a lights performance after a time

Lumen depreciation values reflect the overall performance of a light source through its life. All light sources suffer from lumen depreciation, which can be accelerated by poor thermal conditions, over voltage or incorrect application. L70 is the operating time (hours) until the LED lumen output is depreciated to 70% of its initial lumens.

IP RATINGS

A fittings protection against dust and moisture

Ingress Protection (IP) is a value given to products that have particular protection against dust and/or moisture. The IP number is split, the first digit represents the level of protection against dust particles while the second digit represents the protection against moisture. For example IP00 has no protection against dust or moisture whilst a product with IP68 is dust tight and submersible up to 2m (see page 255 for more information).

Cone diagrams

Cone diagrams describe the amount of light at different distances from a fitting and are measured by the lux level.

Understanding colour temperature

The colour temperature of a light source is measured in degrees Kelvin. Below is a Kelvin temperature chart with examples of how colour temperature is used within different lighting applications.

# Building lighting basics

## KEY FACTORS TO CONSIDER WHEN LIGHTING A BUILDING

It's important to understand who will be using the area and what will be the layout. The following is a simple checklist:

What is the primary use of the area?	The level of light required will depend upon the tasks performed within the area. See CIBSE guidelines below.
What colours are used within the decor?	Dark walls, flooring and furniture can absorb up to 80% of the light.
How much natural daylight enters the area?	Windows, exterior doors and skylights impact the level of light within an environment. To maintain constant light levels the area may require lighting control such as daylight harvesting (see page 259).
Is the ceiling suspended or solid?	Light fittings are often designed for a specific ceiling type. The ceiling within your application may dictate the relevant fittings required.
Is there electrical provision for wall mounted lights?	If lighting new areas where fittings do not replace previous lighting, chasing wiring into the wall may be necessary.
Which regulations are applicable?	The 2014 Building Regulations stipulate key attributes that are required for fittings used within certain areas (see page 256).
What level of maintenance does the area receive?	Without regular cleaning, the light output of all light fittings is reduced. Non-LED fittings require lamps to be replaced dependant upon lamp technology.
Are there environmental considerations?	Older lamp technologies such as CDM can considerably add to ambient room temperatures. Areas with heightened levels of dust, dirt and water may require a level of IP rating (see page 255).

## What is the recommended light level?

### CIBSE GUIDELINES

Public areas with dark surroundings, including car parks	► 10 - 50 Lux
Simple orientation for short visits	► 100 - 150 Lux
Warehouse racking	► 150 Lux
Warehouses, homes, theatres and archives	► 150 - 200 Lux
Simple office work and classrooms	► 300 - 500 Lux
Brighter areas such as bathrooms	► 150 - 200 Lux
Normal office work with computers	► 300 - 500 Lux
Supermarkets and workshops	► 500 - 1000 Lux

## How to add interest to lighting

Good lighting design recognises the need for depth of view. Both ambient and accent lighting should be used, whilst combining colour temperatures to create a more comfortable working environment.

**Ambient lighting** is the general lighting within an area and typically contributes 80% of the overall lighting level.

- Skytile® is a good example of product designed for ambient lighting.

**Accent lighting** adds interest and depth to a design and should compliment but not conflict with the ambient lighting.

This can include wall washing, the subtle use of colour, up lighting and spotlighting.

- Starscoop™ and Hybrid9™ are excellent for accent lighting.

**Mixing warm & cool** coloured lighting within a design can assist a design:

- The ambient lighting can be a cooler temperature to add a more commercial feel.
- Supplement with warm white as accent lighting to create a more dynamic environment.

## Typical areas within commercial applications

### A Meeting & boardroom

The main lighting should be focused on the table areas. Remember to allow control of lighting near screens and displays. Use accent lighting to provide depth, and consider lighting pictures and other features.

### B Office area

Try to allow for flexible use of the space so that desks can be repositioned. The lighting on desks should be greater than general movement areas. Consider the opportunity to use natural daylight, this may require lighting control for daylight harvesting (see page 259). Adequately light emergency escape routes (see page 257).

### C Reception

The reception area can provide a first impression of the business. The ambient and accent lighting should be varied to provide a dynamic feel.

### D Stairwells

Primarily focus on safety by ensuring good light levels. Also consider the emergency requirements for emergency escape.

### E Basement

Natural light and external views are unavailable and therefore it's vital to create depth of design by mixing accent and ambient light with variations in colour temperature.

### F Showroom

The primary focus should be on the products being displayed. Track lighting can provide flexibility for changes of use (see StarSpot™ pages 162-167, 177-179). Good CRI (see page 249) is important to ensure that colours are displayed correctly, LED lighting can have good and consistent CRI. Also consider the reliability of the lighting, a long L70 (see page 249) is important or the products will become dimly lit over time as product performance deteriorates.

### G Exterior

Consider the security requirements and the safe passage of people when entering and leaving the building. Good exterior lighting can dramatically change the look of a building so consider both lighting the area around the building and the elevations of the entrance area and side walls.

# Understanding bathroom zones

IEE Wiring Regulations, BS 7671: 2008, Section 701 gives requirements for areas containing a bath or shower. This document should be consulted before installation of appliances.

Areas of the bathroom are split into zones. As a guide only, the requirements for luminaries in each zone may be summarised as follows. Particular care should also be taken with wash basins. Guidance for these are also contained within BS 7671.

## Zone 0

Refers to the interior of the bath or shower that can hold water. Requires electrical products to be low voltage (max. 12V) and rated IPX7.

## Zone 1

Refers to the area above the bath or shower up to a height of 2.25 metres and requires a minimum rating of IPX4 (splash-proof), plus RCD protection. IPX5 should be considered if water jets may be present i.e. for cleaning purposes.

## Zone 2

Covers an area 0.6 metres wide immediately next to, and all around Zone 1. Wash basins should also be treated as Zone 2. The minimum rating here is IPX4.

# IP Numbers

## Protection explained

Explanation of IP numbers for degree of protection (for example: IP65)

### First Numeral

Short Description
0 Non-protected
1 Protected against solid objects greater than 50mm
2 Protected against solid objects greater than 12mm
3 Protected against solid objects greater than 2.5mm
4 Protected against solid objects greater than 1.0mm
5 Dust - Protected
6 Dust - Tight

### Second Numeral

Short Description
0 Non-protected
1 Protected against dripping water
2 Protected against dripping water when tilted up to 15°
3 Protected against spraying water
4 Protected against splashing water
5 Protected against water jets
6 Protected against heavy seas
7 Protected against the effects of immersion
8 Protected against submersion

Example **IP6X**

Example **IPX5**

# 2014 Building Regulations

## Part L

### Non-Domestic/Commercial

#### MINIMUM LIGHT FITTING PERFORMANCE

- **General lighting in office and industrial** – 60 lumens per circuit Watt
- **Display lighting** – 22 lumens per circuit Watt

#### LIGHTING CONTROLS WILL REDUCE THE REQUIRED EFFICIENCY OF THE LIGHT FITTING

		Control factor													
<b>A</b>	Day lit space with photo-switching with or without override	0.90	✓						+	+					
<b>B</b>	Day lit space with photo-switching with or without override + dimming	0.85		✓							+	+			
<b>C</b>	Unoccupied space with automatic on/off occupancy	0.90			✓				+		+		+		
<b>D</b>	Unoccupied space with manual on/off occupancy	0.85				✓				+			+		+
<b>E</b>	Space not day lit, dimmed for constant illuminance	0.90					✓							+	+
<b>Minimum performance required from a fitting with lighting controls</b>			<b>54</b>	<b>51</b>	<b>54</b>	<b>51</b>	<b>54</b>		<b>48</b>	<b>45</b>	<b>45</b>	<b>42</b>	<b>48</b>	<b>45</b>	
															<b>Combined LpcW</b>

#### Introducing LENI (Light Energy Numeric Indicator)

LENI is a measurement of the buildings energy performance in energy usage per sq/m.

##### The methodology:

Divides the building into zones according to:

- **Task type** – and hence required luminance (see page 250)
- **Daylight availability**
- **Annual usage**
- Calculates annual all-lights-on power usage for each zone
- Discounts by applicable control factors
- Adds fixed allowance for standby power consumption
- Compares the result with the Part L allowance

For more information: [www.thelia.org.uk](http://www.thelia.org.uk) and see lighting guides.

## Domestic

#### MINIMUM LIGHT FITTING PERFORMANCE

- **Internal lighting** – At least 75% of all the light fittings in the main dwelling spaces (excluding infrequently accessed spaces used for storage) must have light fittings with an efficacy greater than 45 lumens per circuit Watt and total light output greater than 400 lumens.
  - Light fittings of less than 5 circuit Watts, such as FGLED3®, are excluded from the calculation.
- **External lighting**
  - Either
    - Light fitting and lamps of greater than 100 Watts must be automatically controlled to switch off after the area becomes unoccupied and automatically controlled to switch off when daylight is sufficient.
  - Or
    - If the light fittings are better than 45 lumens per circuit Watt then they should be automatically controlled, so as to switch off when daylight is sufficient and can be manually controllable.

# Emergency lighting

## What is an emergency light fitting?

Emergency light fittings include a battery as a backup power source that is continuously charged. Emergency light fittings can tell when the power has failed and immediately switch to using the backup battery. The battery needs to power the light fitting for a minimum of 3 hours. To conserve power, the light output from the fitting is reduced, often to 10% of the normal light output.

## What are the different types of emergency light fittings?

**Maintained fitting** – will operate as a normal light fitting and be controlled with all the other lights in the area, however when the power fails the maintained emergency fitting will continue to operate but, at a lower light level.

**Non-maintained fitting** – is normally switched off, with its batteries being continuously charged and a green LED showing fully charged. When the power fails then the fitting switches on using its battery supply. Non-maintained fittings are not part of the general lighting but are fittings such as emergency exit signs.

All JCC emergency light fittings can operate as a maintained and non-maintained light.

## Open areas

The non-obstructed, quickest and safest escape route must be lit to a minimum of 1 lux during an emergency. If the open area is less than 60m<sup>2</sup> and isn't part of an escape route then emergency lighting isn't required, however the exit doors for the emergency escape route must have signs or an emergency bulkhead light.

## An escape route such as a designated corridor

An escape route must be unobstructed and lit to a minimum of 1 lux during an emergency.

## Stairwells

Due to increased hazards, these areas need to be lit to a minimum of 2 lux during an emergency.

# Controlling lighting

## Why control lighting?

Switching to LED from traditional lighting technology, such as halogen or fluorescent, can provide up to 90% energy savings. However, LED lighting can provide other benefits, such as instantly controlling on/off without deterioration in the fittings operating life. These benefits are suitable for lighting control and allow for significantly improved energy savings and a better lit environment.

## Lighting controls can provide an additional 50% energy saving

The government recognises the benefit of lighting control and is starting to introduce regulation that focuses on improvements in the energy efficiency of a complete building. The introduction of Building Regulations Part L (2013) is an example of this change and introduces the concept of a Lighting Energy Numeric Indicator (LENI – see page 256) that calculates the energy usage of a building per metre<sup>2</sup>.

## LENI

LENI is a new measurement of lighting that changes the focus from the performance of an individual fitting, to the performance of the full lighting installation (see page 256).

## What are the types of lighting control?

Good lighting control systems should adjust the lighting to compensate for changes in daylight levels and the usage of the area. The main types of control are:

### 1 ABSENCE DETECTION

Manual on, auto off

Lighting is switched on using a time switch or detection from an occupancy sensor.

The lighting stays on using a timer.

The lighting is automatically switched off after a specified period of time.

### 2 PRESENCE DETECTION

Auto on, auto off

The lighting is switched on after detection by an occupancy sensor.

The sensor detects any further activity.

The lighting is switched off when the sensor doesn't detect any further activity.

### 3 DAYLIGHT COMPENSATION

#### Harvesting

The cheapest and best form of lighting is natural daylight. Lighting controls can be designed to adjust the light output from the light fittings when the amount of daylight in a room changes throughout the day and seasons.

### 4 CONSTANT ILLUMINANCE

Light fittings lose some of their brightness over time, measured as the time taken to lose 30% of the original light output (L70). LED lights generally have a much better L70 performance than traditional lighting. If lighting controls are used then the area can be maintained at the correct level (maintained level).

However, if controls are not used then the options available are to:

- Initially over-light an area which will achieve the correct future lighting level, or
- Initially light an area to the correct level and accept that in future the light level will deteriorate.

#### WITHOUT CONSTANT ILLUMINANCE

#### WITH CONSTANT ILLUMINANCE

# Components of lighting control systems

A lighting control system is constructed from a range of individual components that may be supplied by different manufacturers. Understanding these components and their ease of integration is important when designing a good lighting control system.

## DRIVERS

Drivers are the electronic systems that manage the power to an LED fitting and therefore change the light output. The primary driver types are:

### Non-dimmable

The driver cannot adjust the power to the LED fitting and can therefore only be switched on/off.

### Dimmable

The power to the LED fitting is changed by the driver when it receives a signal from a controller.

### Step dimming

The power to the LED fitting can be changed but only in fixed incremental amounts. This is useful when limited illumination is required for safety or security.

## DETECTORS

Detectors provide the lighting control system with information on its environment; has the light level changed or are there people in the area? Multi-sensor technologies can be combined into a single detector or operate separately.

The primary sensor types are:

### PIR

Identifies people by looking for changes in the heat pattern, heat is always generated by people.

### Microwave

A transmitter sends out microwaves that bounce off people and are received back at the sensor. These detectors can be more robust than a PIR but travel through walls and can cause unplanned detection.

### Ultrasonic

Operate on the Doppler principle by emitting ultrasonic high-frequency sound waves into the room and then monitoring the variations of that signal as they return to a microphone within the sensor.

### Photocell

Detects the amount of light entering the sensor.

## SWITCHES

Switches are the manual method of managing lighting.

The primary switch types are:

### On/off

Simply interrupts the electrical supply to the light fitting.

### On/off timed

Switches the lights on for a pre-programmed time and are often used in communal access corridors and staircases.

### Dimmable

Switches allow adjustment of the lighting, often adjusted by rotation or the length of time the switch is held down.

## TRANSMISSION OPTIONS

There are three primary types of transmitting control information to light fittings:

### Mains power

Simple to install as it only requires a mains supply cable and is used for applications that use limited power such as domestic lighting. Phase dimming uses this form of transmission and the dimmable FGLED® range uses this technology.

### Separate control wire

Used to control most commercial applications where the power usage is greater. Allows the transmission of 1-10 Volt, DALI, and DSI directly to the light fittings.

### Wireless transmission

Used to transmit a digital signal and doesn't require a separate control wire, however wireless links can suffer interference and are limited in range particularly where walls and metal objects exist. ZigBee is an example standard that allows meshing to increase range and reliability.

# Communication protocols

Communications protocols are the method of transmitting information to the light fittings.

## PHASE DIMMING

Uses the mains alternating current (AC) to reduce power to the light fitting by cutting out sections of the AC supply. Phase dimming was designed for traditional lighting technology and is common in lower power domestic lighting but is unsuitable for commercial applications due to the larger power requirements.

The supply can be cut from:

- The front of the AC wave (leading edge dimming) and/or
- The back edge (trailing edge dimming)

- Separate control wire not required
- For lower power applications

## 1-10 VOLT ANALOGUE

Uses a separate control wire to notify the driver that the power to the LEDs should be changed. The separate control signal is a direct current (DC) and can be adjusted from 1 up to 10 volts, the voltage level is interpreted by the driver to set the LED power.

- No setup, easy installation
- No third party commissioning or site visit

This method of control is a low current system (typically 1mA) meaning it can be run along relatively thin cables with little voltage drop and depending on dimmer manufacturer recommendations, allows for up to 50 LED dimmable drivers on one wall mounted dimmer.

## DALI (DIGITAL ADDRESSABLE LIGHTING INTERFACE)

This is a digital communications protocol that was developed for the lighting industry. A separate control wire or BUS is used to send digital information to light fittings and allows the individual light fittings and sensors to communicate with an advanced lighting control system. Although DALI is a standard protocol beware of mixing components between manufacturers without first testing. Along with the correct LED driver the DALI system requires additional control equipment including DALI BUS controllers, power supplies, sensors and user interfaces.

- Fully programmable lighting sleeves
- Individually addressable light fittings

**DSI (Digital Serial Interface)** – developed by Tridonic, the driver manufacturer. The specification is simpler than DALI but doesn't have the same general industry support.

# Who to contact

## SALES MANAGERS

### REGIONAL SALES MANAGERS

- 1** **CHRIS CARR**  
**TEL: 07740 065526**  
The North of England
- 2** **RICHARD BRISTOWE**  
**TEL: 07710 109141**  
Midlands, South West & Wales
- 3** **ADRIAN CRISP**  
**TEL: 07713 641939**  
South East, London & East of England

### AREA SALES MANAGERS

- 4** **JAIME ELLINGHAM** | **TEL: 07917 506880**  
Humberside, East Midlands, East Anglia  
(Northamptonshire only), Peterborough  
& Hull
- 5** **RYAN HOWARD** | **TEL: 07740 065525**  
Lancashire, Manchester, Severn  
(Cheshire only), North Wales
- 6** **BILL MONAGHAN** | **TEL: 07850 764949**  
South East, South (Surrey only),  
London (South only)
- 7** **CLAIRE HIGGINS** | **TEL: 07867 455258**  
Essex (Buckinghamshire, Hertfordshire),  
East Anglia (Bedfordshire only), South  
(Berkshire only), West (Oxfordshire only),  
Northampton
- 8** **LAUREN KELSEY** | **TEL: 07880 384420**  
London (central, south east, north, east),  
Essex (Southend, Ilford, Romford only)
- 9** **VICTORIA FOSTER** | **TEL: 07551 158488**  
East Anglia, Essex
