# Cable support is the backbone of our total power and network offer

With a powerful and extensive range of cable support products from Schneider Electric, our customers can feel confident that there is always a strong backbone to build their solutions around – whether in a shopping centre, heavy industry or an off-shore environment.

Cable support is an essential ingredient of the total Schneider Electric offer, from power distribution to building management.

P138084

In the late 1920s, the founders of Wibe, Mr Wikstrand and Mr Berg, realised the advantages of using a ladder horizontally as well as vertically. And that the horizontal ladder was ideal for carrying cabling. Since then, the product range has grown to include a vast amount of ladders, trays and accessories suitable for a variety of applications and environments.

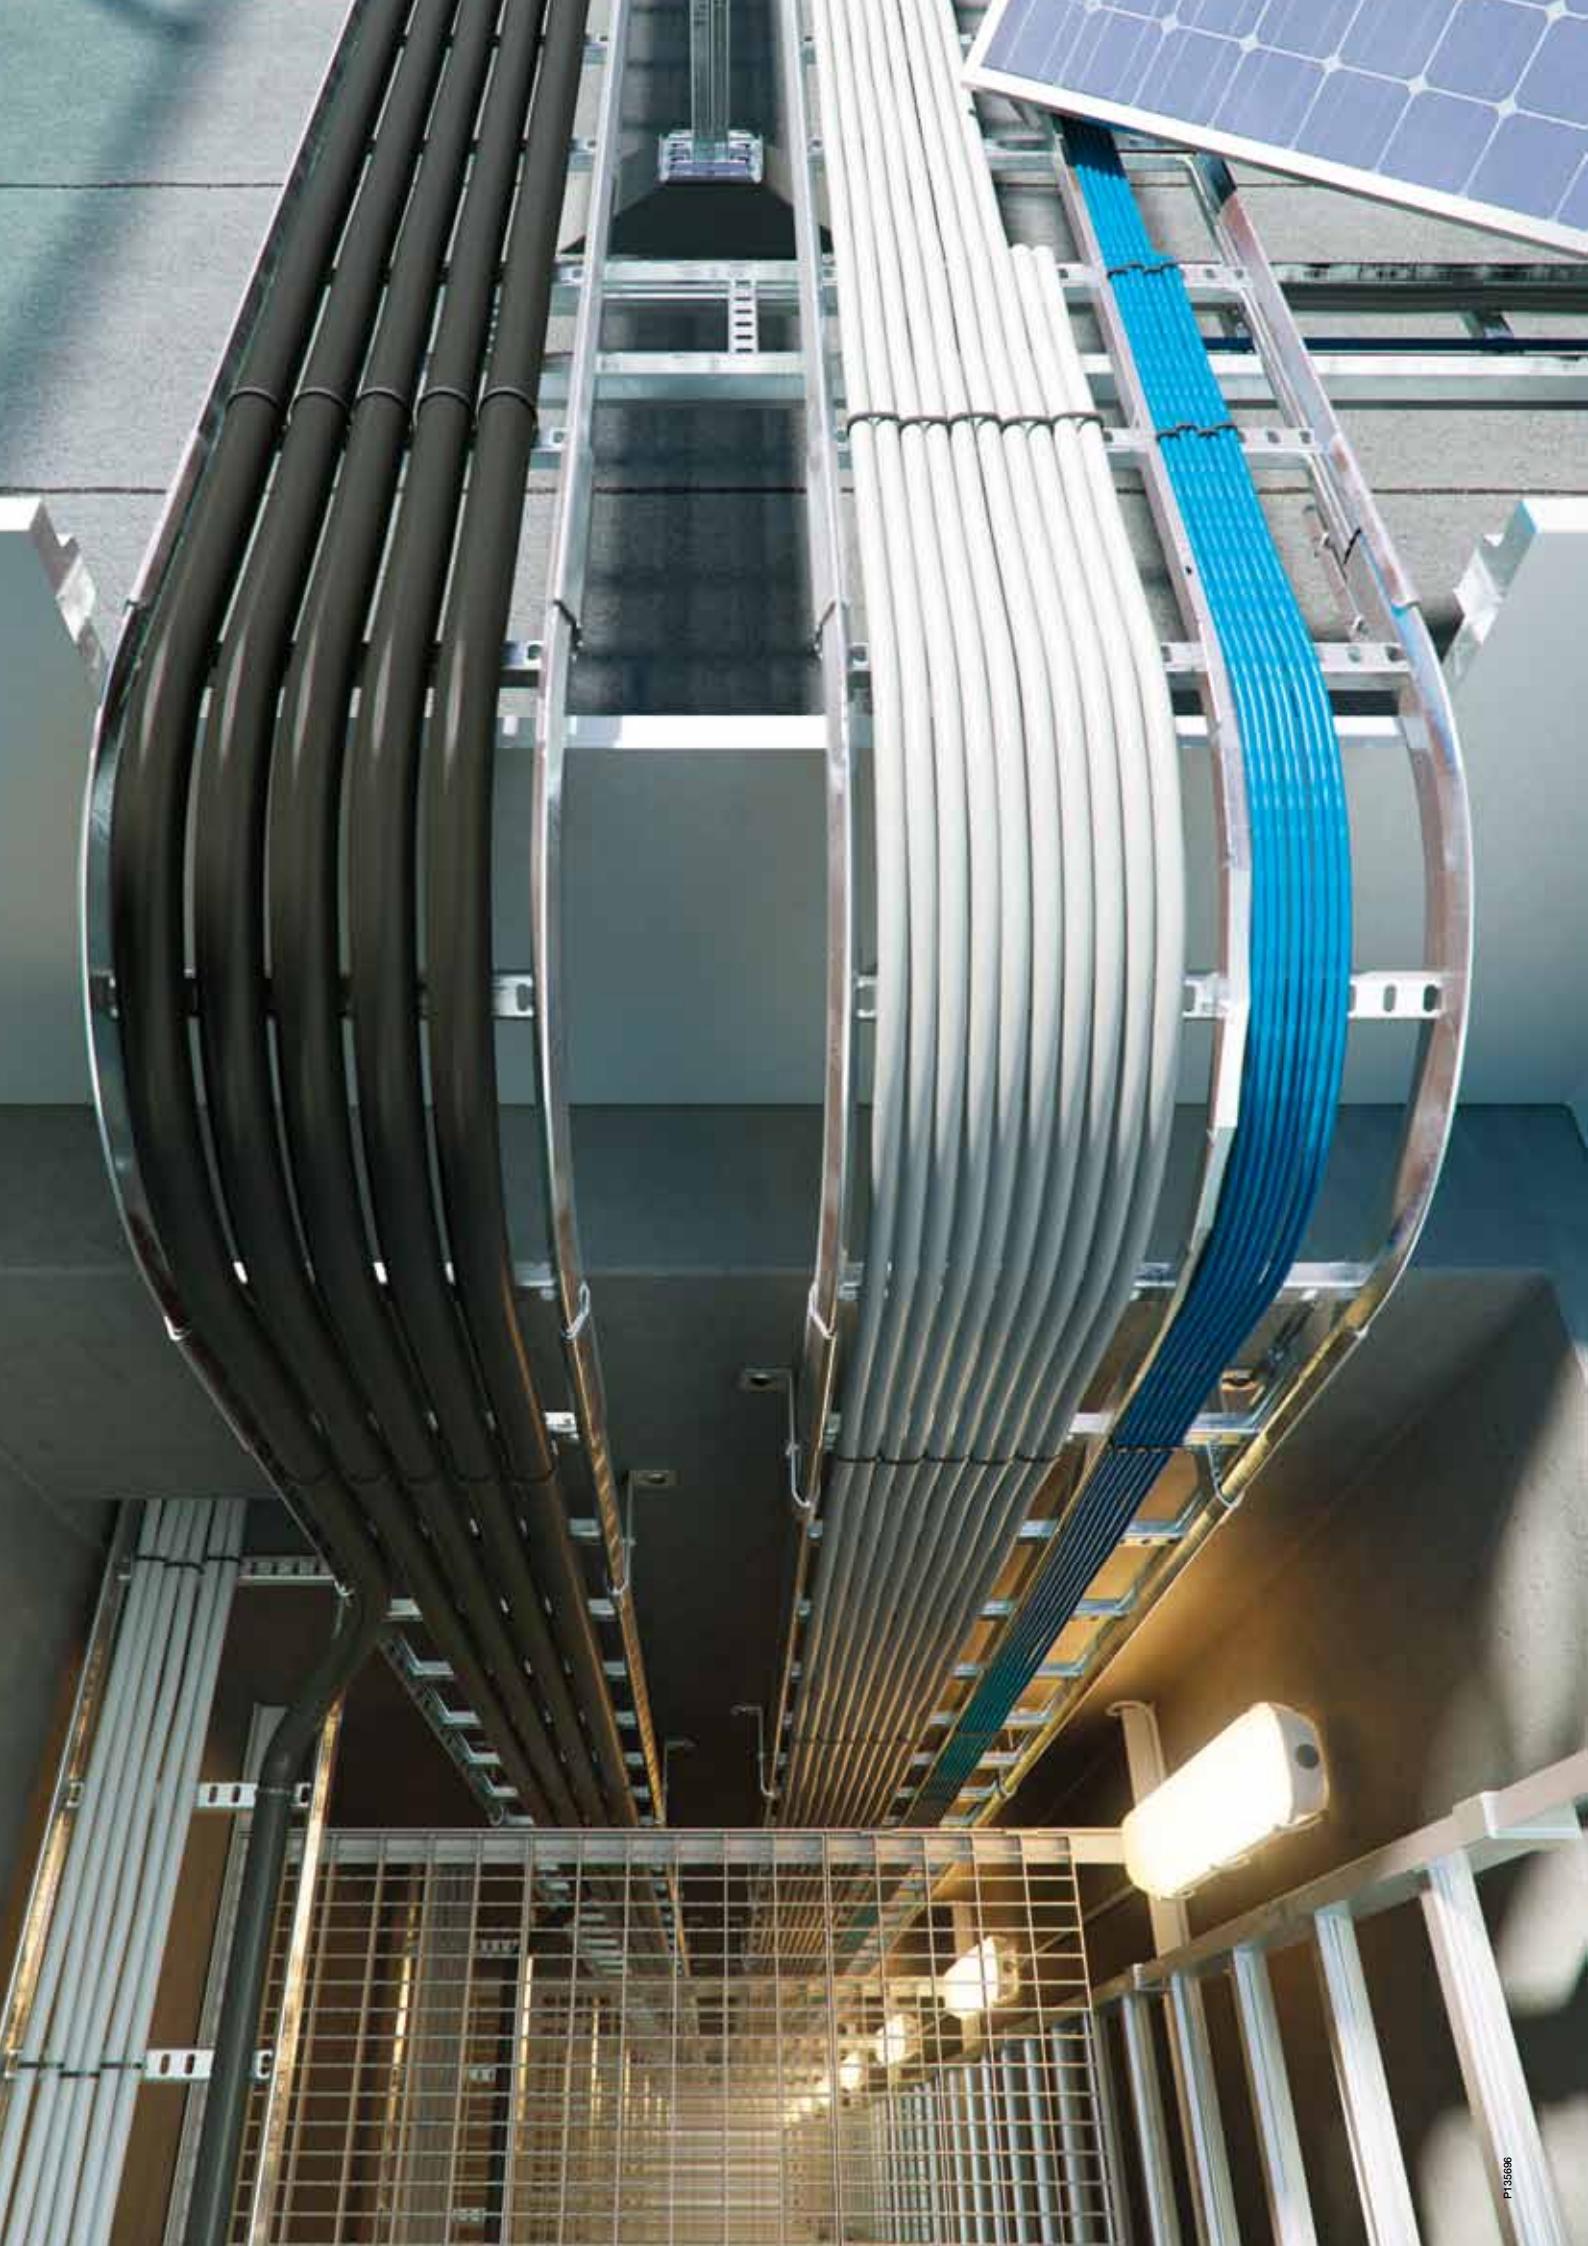

Our cable support range contains all the necessary elements for a complete solution – mesh trays, cable trays and cable ladders along with a wide variety of accessories.

## Fully integrated

Wibe is a fully integrated part of Schneider Electric. This means that our customers, to an even greater extent, can benefit from the comprehensive Schneider Electric offer.

# Wibe cable ladders

# The spine of an exceptional infrastructure

The cable support system is as essential for the building's infrastructure as the bone structure for the body. Wibe cable ladders are robust and functional, enabling the same ladder to be used both horizontally and vertically. Add to that the extensive range of accessories as well as the wide variety of surface treatments – and you will have a safe and easily maintained solution which can be mounted in any direction or angle to fit around bends and curves in any environment.

# Organised and ready for constant change

In a high-tech industry the infrastructure needs to be modular and flexible, minimising the risk of costly downtime when shifting to a new design or model. This is why the Wibe cable ladder system must be agile enough to be completely reconfigured in a matter of days.

An advanced industrial environment can put a strain on the power and network infrastructure. For Wibe cable ladders, there is no application too complicated. Our cable ladder offer includes a wide range of dimensions and accessories like

bends, raisers, cantilever arms, brackets, joints, couplers and much more, making the entire solution flexible and adjustable enough to take on any challenging task.

#### The challenge

A typical urban environment. Thousands of people commuting every day. It is busy and crowded. Departures and arrivals on time are vital and what everybody expects. And there is no room for an inadequate infrastructure.

P136735

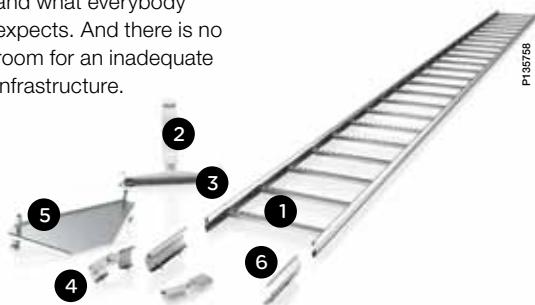

A smart feature is the drainage holes placed at the top and bottom of the open profiles of the KHZSP stainless steel ladder, preventing moisture from filling up.

#### The solution

This installation includes only a few parts:

1. KHZSP Cable ladder in stainless steel
2. Round bar fixing for ceiling
3. Support bracket 3
4. Coupler 22
5. Angle plate 33
6. Joint 21

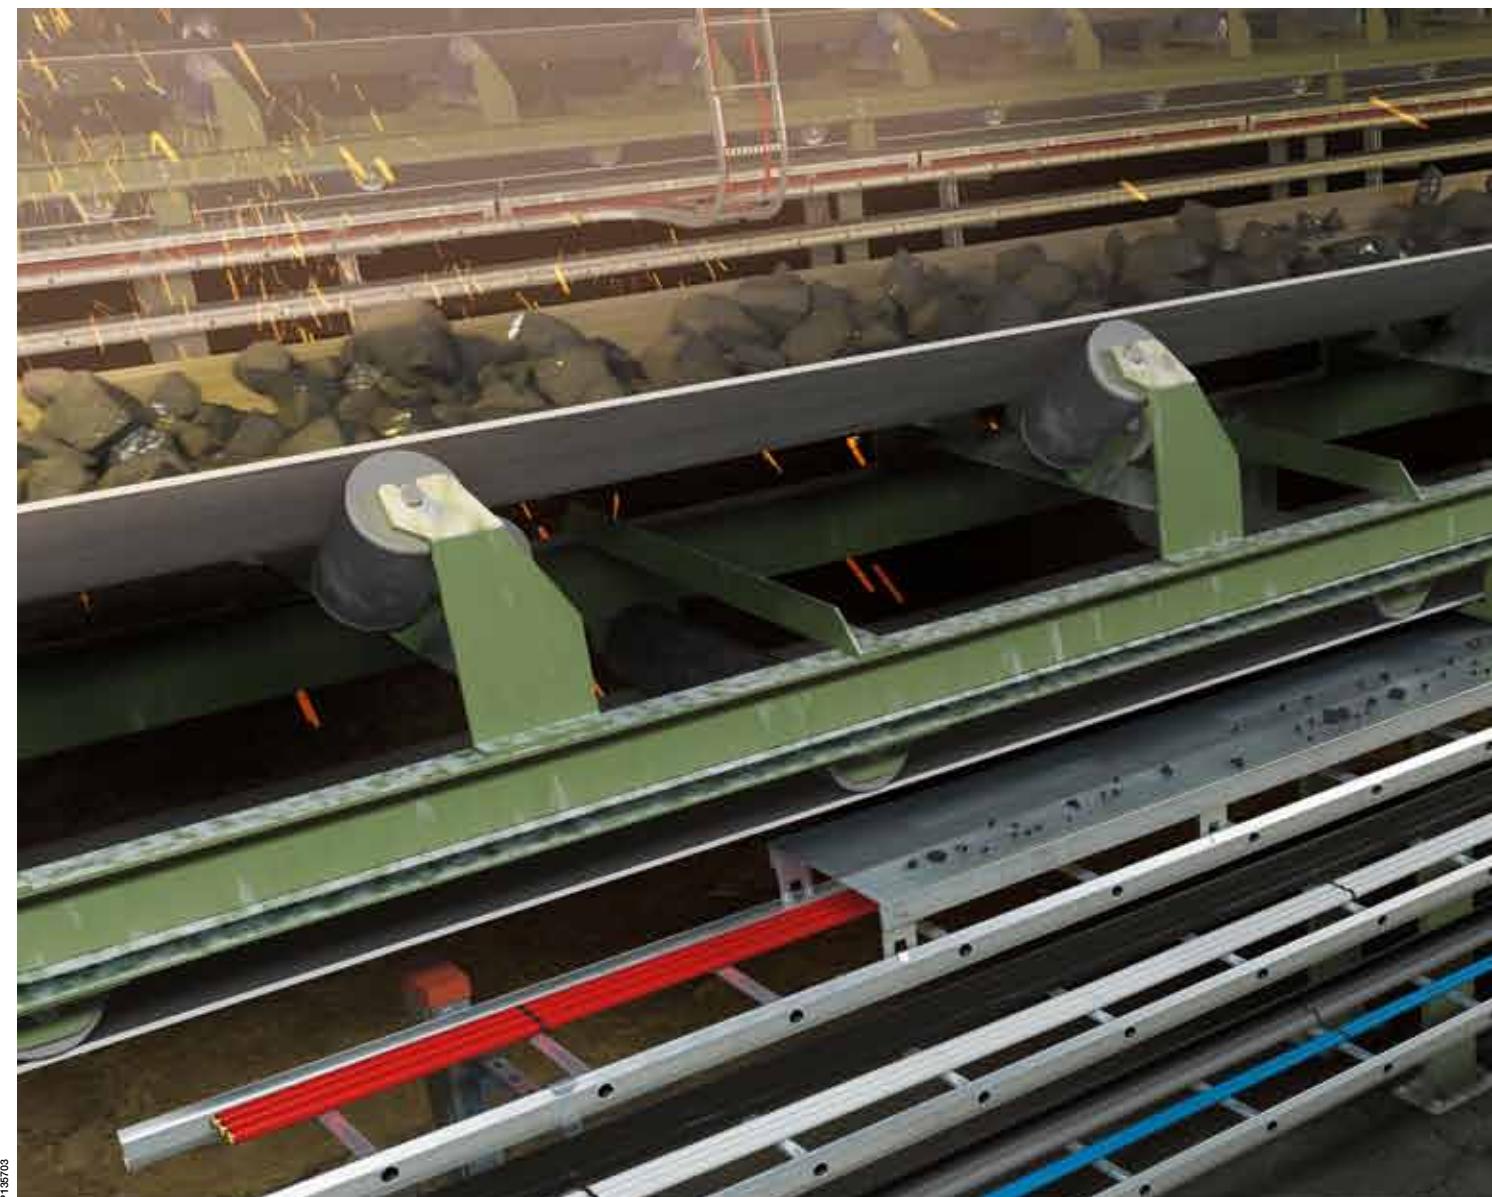

## On track with the future

Today we constantly meet increasing expectations on performance, flexibility and sustainability. Advanced constructions require top quality in every detail and keeping up with technical development is a challenging task. Our goal is to prosper business performance whilst conserving environmental resources.

The monorail train illustrates a modern, technological city infrastructure but the idea of an elevated train on a single track actually dates back to the beginning of the 20th century.

Today the monorail trains are often used as fast intercity connections, running through tunnels and open landscapes, exposed to rain, ice and snow – at a speed often exceeding 300 km/h - yet the

journey is smooth, comfortable and quiet. Accentuating demands on capacity and comfort have spurred the development of advanced technique and sophisticated design. With the comprehensive offer which is constantly refined and improved, Wibe cable ladders exceed all the requirements.

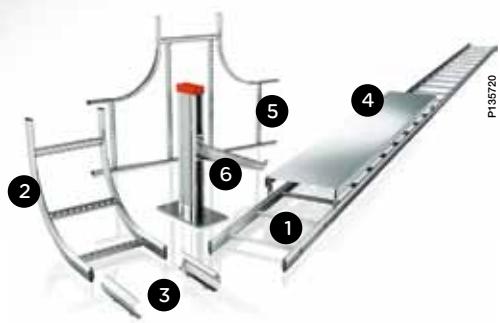

P135703

#### The challenge

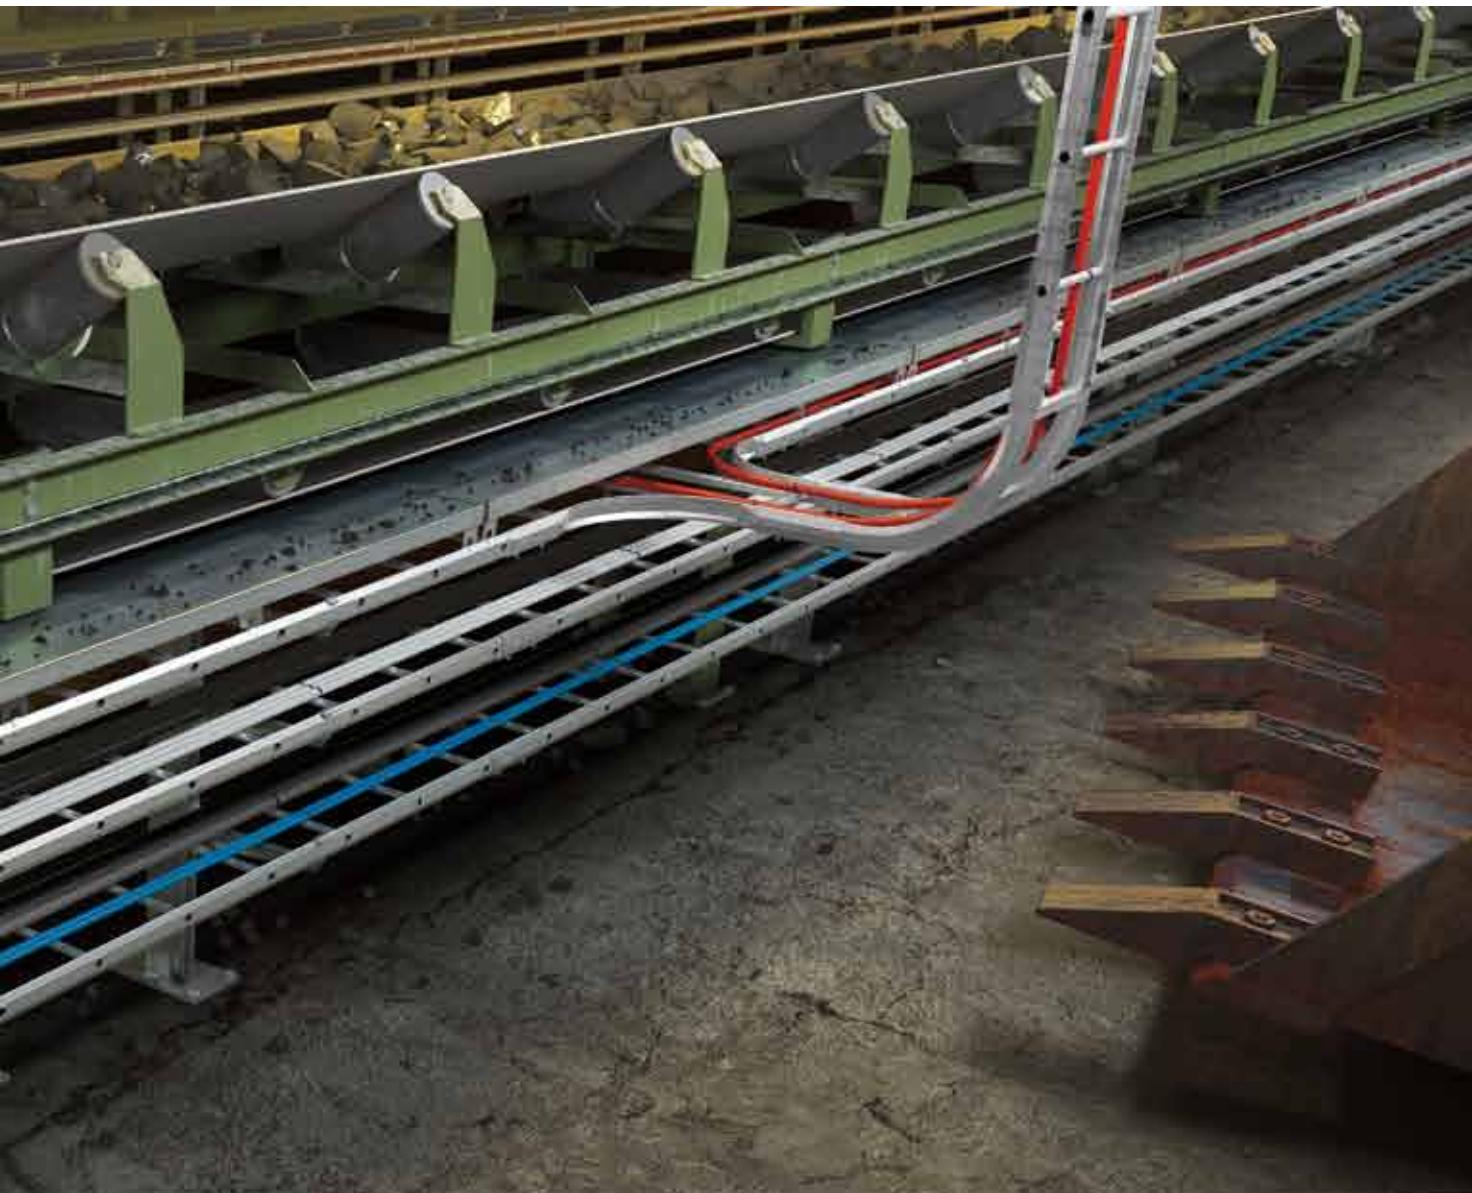

Heavy industrial environment with a lot of pollution. Uptime is crucial, no room for costly production shutdowns.

#### The solution

These are the only parts needed:

1. KHZ Cable ladder in hot-dip galv
2. Riser 18
3. Joint 21
4. Cover plate
5. T-junction 16
6. Vertical piece 20FS, Cantilever arm 50, End cap

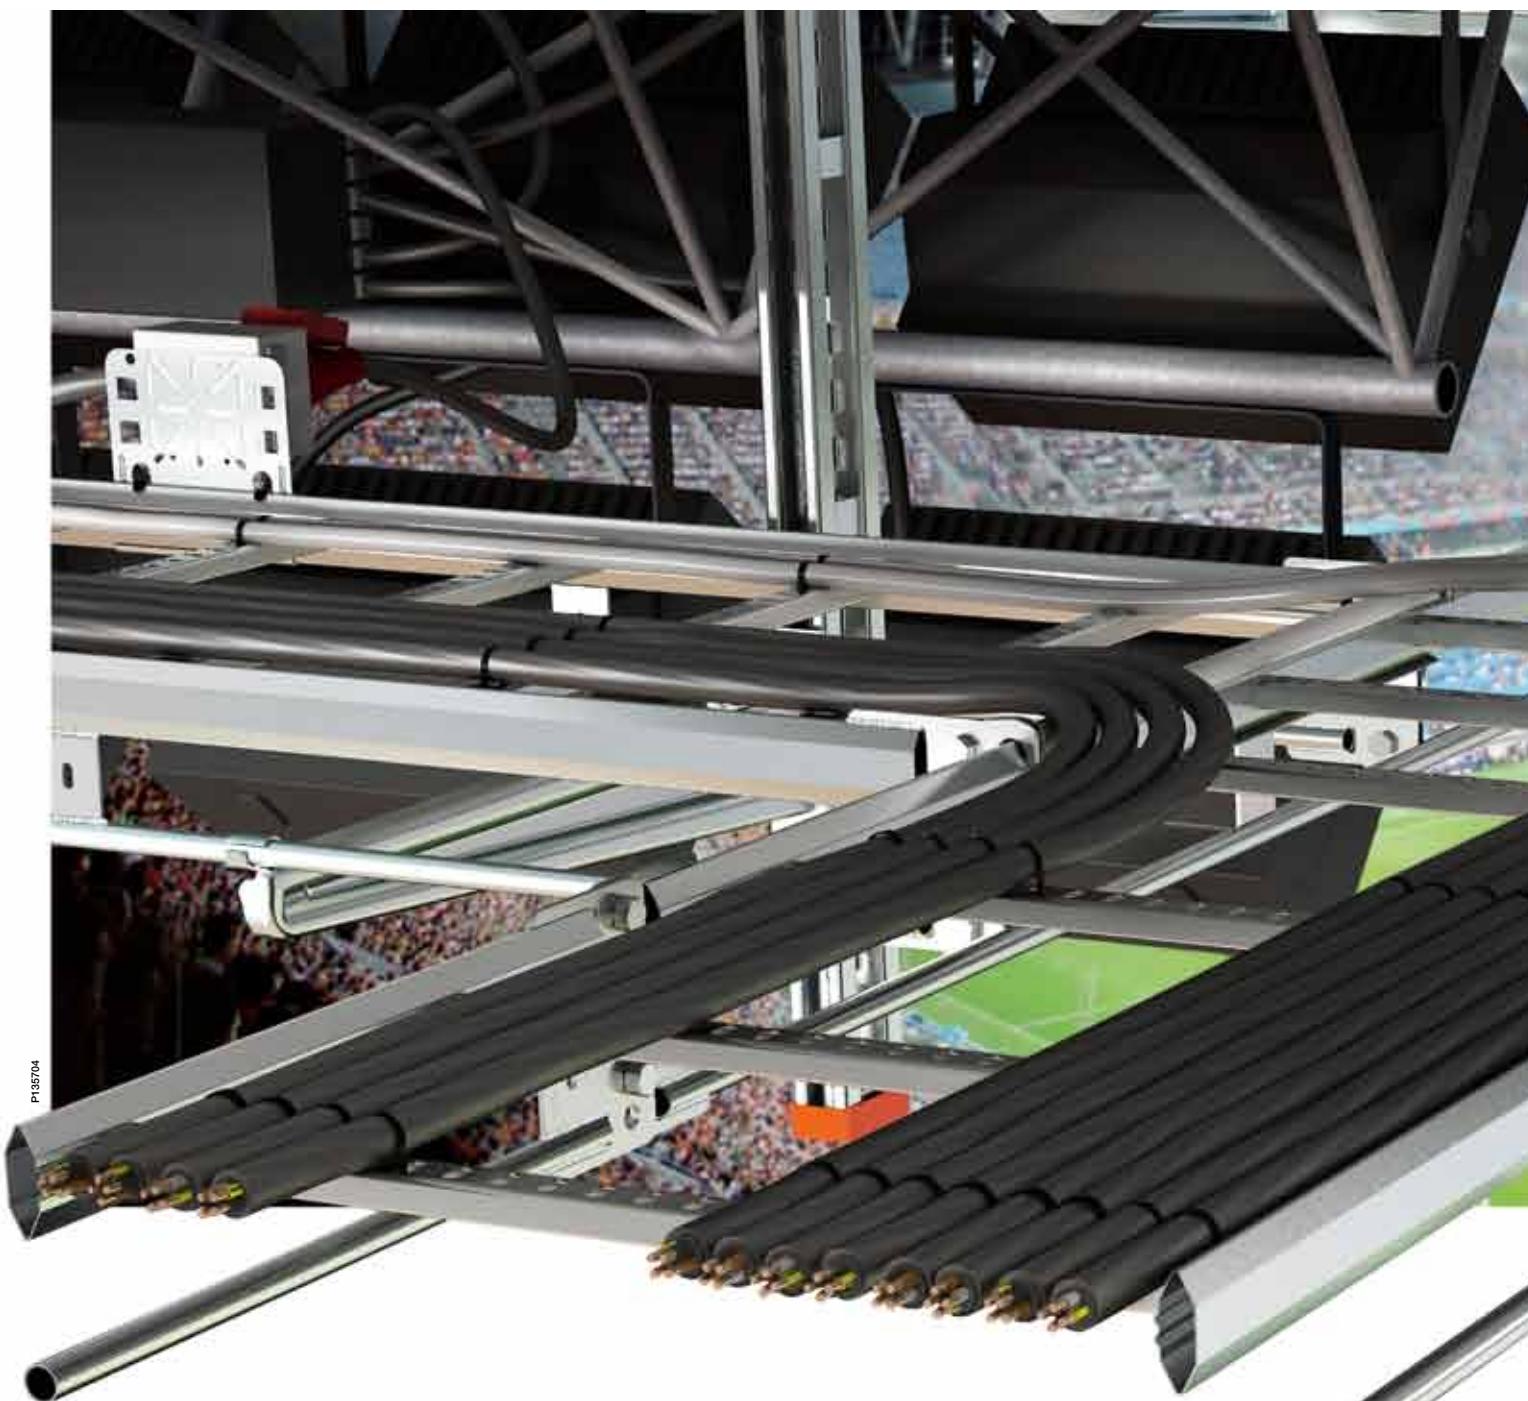

# Breaking ground for heavy-duty applications

No environment is too tough or too dirty. With the appropriate material and ideal surface treatment of the cable support solutions, reliable power and network supply is secured.

In noisy, busy and very harsh conditions, maintaining continuous production is the priority and any malfunctions will jeopardise both safety of the staff and the all-important profitability. Here the cable support solution is really put to the test. The standing vertical

pieces can carry several layers of ladders on top of each other, securing easy maintenance and service. Details such as round rungs and cover plates protect the installation from dirt and damage.

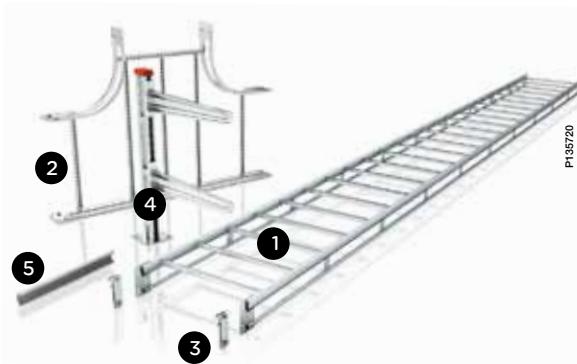

#### The challenge

An environment like a huge sports arena calls for extra strong solutions – both in terms of safety and easy maintenance in unusual spaces.

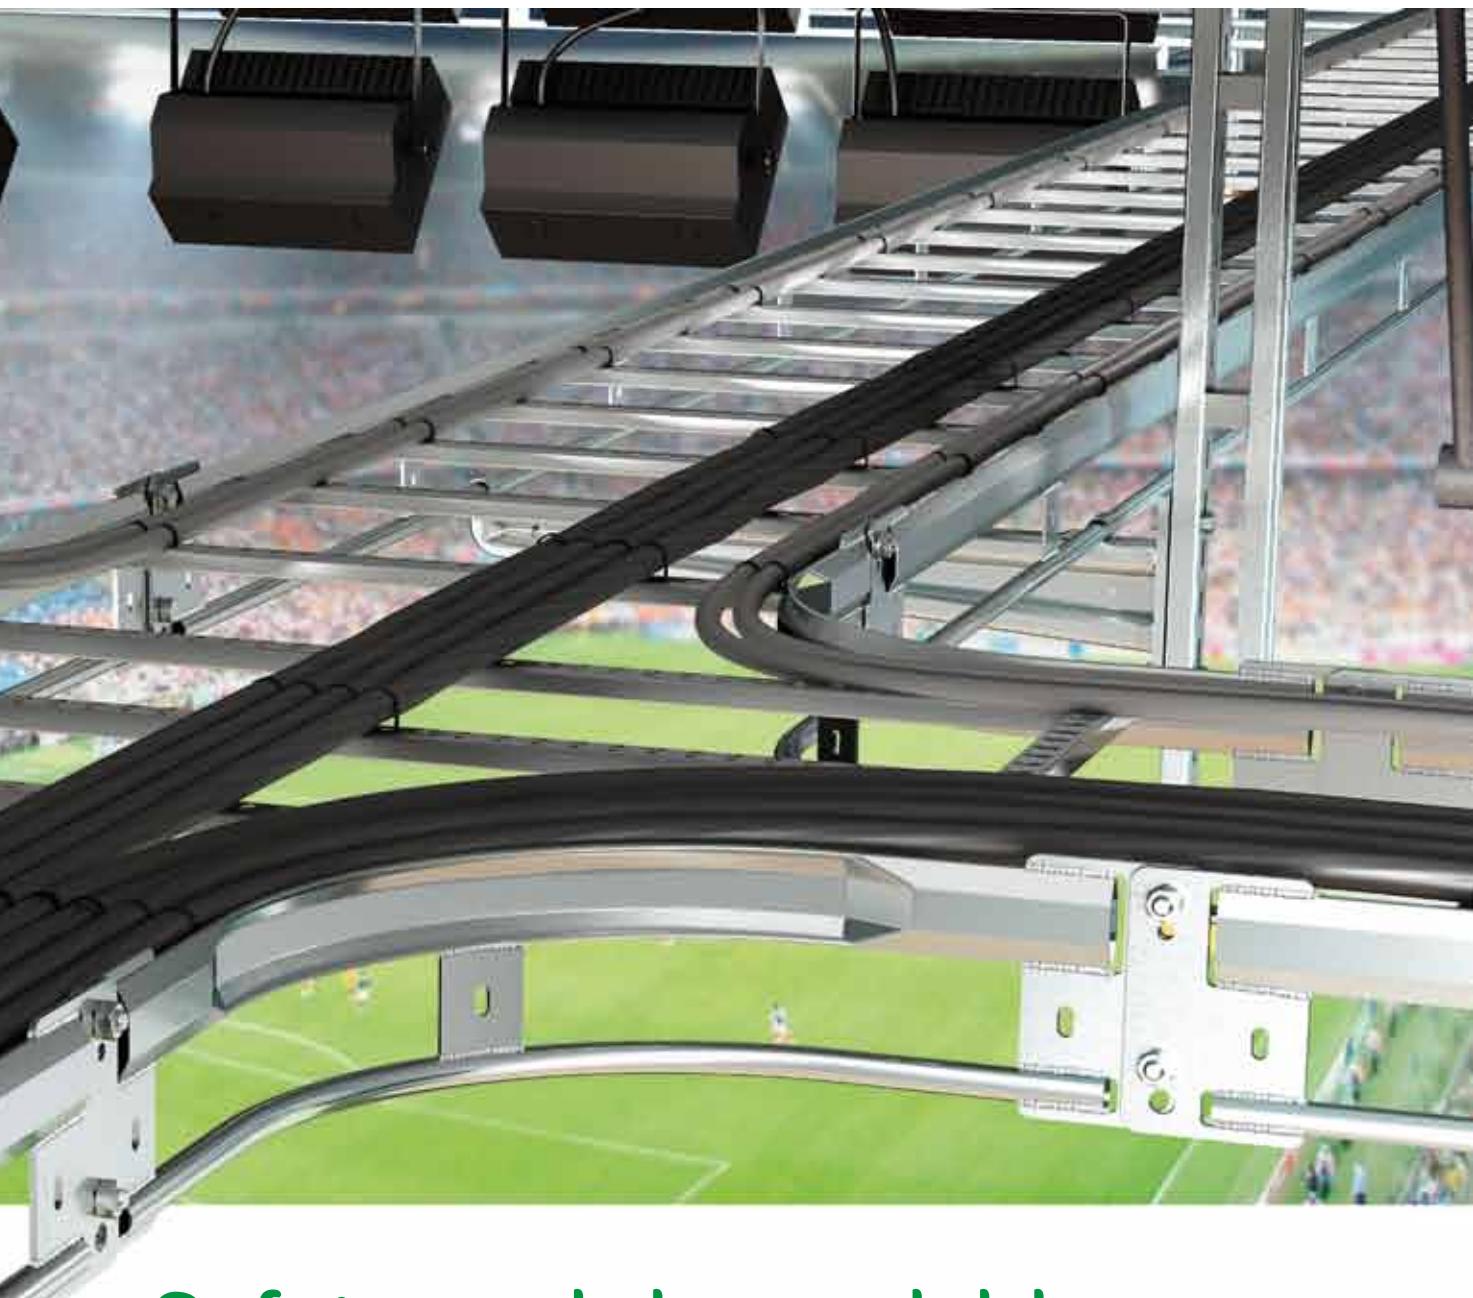

#### Few but strong

The installation above is assembled with a limited number of parts:

1. KHZPV Cable ladder in hot-dip galv
2. T-junction 56
3. Take-off hook 47
4. Vertical piece 20F
5. Cantilever arm 50F
- End cap
- Profile protection

## Safety and dependable operation in focus

Tens of thousands of people, roaring, cheering, all eyes on the game. High above is the headlight system, sustained by an extensive infrastructure of cable support solutions. Downright performance is what everybody expects and what they can count upon.

If the task is to support error-free, reliable lighting for the field and the audience along with power and network supply for broadcasting, only the strongest is good enough. Wibe reinforced ladder KHZPV has an impressive distribution load of 150 kg/m (at 4 m support distance), backed up by sturdy vertical pieces, cantilever arms, junctions,

etc. Another good feature is the profile protection, allowing safe tap-offs with secured maximum bend radius anywhere on the ladder. Equipped with a label, the profile protection can also be used for clear marking and identification.

# Accessories and benefits

## Screwless joint

When joining two ladders the screwless joint is very handy. Just snap it in place. The joint is suitable for fitting of 90° bends, T- and X-junctions and vertical mounting. No extra earthing is necessary.

## Coupler 22

This ingenious coupler allows mounting of horizontal or vertical branches at any desired angle. It can be used for 90° bends, T-junctions, X-junctions or as a riser.

In the section Use and installation in this catalogue you will find a number of installation examples.

## Take-off hooks

Convenient hooks for use on ladders to make 90° branches. Just hook on and take off at any place on the ladder. Equipped with an extra hole for earthing or when vertical locking of the ladder is needed.

## T-bolt 26F

This clever bolt has a rubber pad which allows it to stick anywhere in the fixing rail before it is even fixed. Just apply the T-bolt in the desired position, adjust it if necessary and then fix it in place by tightening the nut.

P136745

## Junction box plates

The multi-purpose junction box plate 35S can be mounted in standing or hanging positions on the side sections of the cable ladder. The pre-defined hole pattern fits both LexCom and Actassi connectors.

The junction box plate 35P is intended to be mounted between the rungs of the cable ladder.

P136740

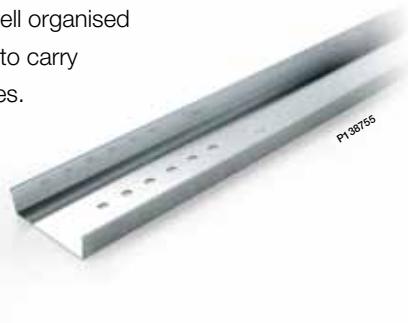

35S

P136749

## Tele-conduit

Keep the entire installation tidy and well organised  
– the tele-conduit enables the ladder to carry both power cables and network cables.

P138755

P138748

## Support

The different supports like vertical pieces, fixing rails, cantilever arms and brackets are delivered in numerous sizes, offering swift flexibility as well as strength and organisational qualities to any complex installation.

P138754

P138751

## Cable roller

The cable rollers simplify pulling of cables. The rollers are adjustable in height to allow cables to pass underneath. Suitable for 90° bends, T- and X-junctions as well as risers.

P138756

# Certified according to DIN4102-12 for fire resistance E30 and E90

The longer the installation is resistant to fire, the longer the electric system will be able to operate normally. Wibe products with E30 and E90 certification can help decrease the number of casualties in the event of a fire. The well-proven, reliable system will prolong the access to critical emergency services, such as fire suppression systems, emergency lighting, ventilation and other basic installations.

The Wibe cable ladders meet the toughest product standards:  
IEC 61537  
UNE EN ISO 9227  
DIN 4102-12 for fire resistance E30 and E90

The Wibe cable ladder system is also approved by Det Norske Veritas (DNV) for offshore and shipyard use.

The Wibe cable ladder system is also approved according to UL E-80034 for use in the US and Canada.

## About the test

A selection of the Wibe products have proven excellent fire resistance properties. You can have confidence when installing Wibe cable ladders in environments requiring both E30 and E90 certification.

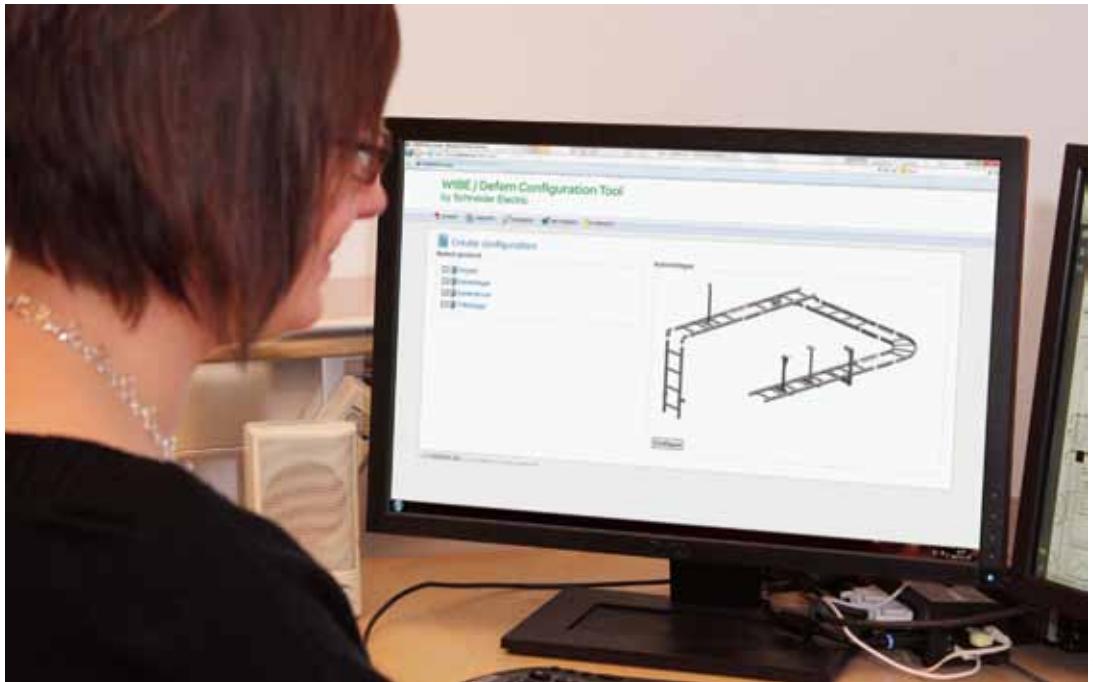

The cable ladders with supporting system and Dätwyler Pyrofil KERAM E30 and E90 cables were tested for 90 minutes in a temperature of up to 1000°C without collapsing and with the electrical performance still remaining intact.

For installation specification please see the Technical section of this catalogue.

# Our configuration tool – the right choice

Eliminate waste and maximise usability and efficiency by using our configuration tool.  
Available at:  
<http://wibe.combinum.eu/>

P138782

The smartest way to be efficient and profitable is to cut down on costs. Material which is either insufficient or oversized, means money down the drain. Our configuration tool helps you calculate the dimensions you need, eliminating waste of your time, money and effort.

## Make your specification accurate, flexible and up-to-date

The Wibe/Defem configuration tool is a unique and user-friendly assistant to specifiers, wholesalers and installers. The tool is free of charge and perfect for optimising the amount of material for any given installation. No previous experience is necessary – all you need is a standard web browser and a personal login (provided from Schneider Electric) and you are ready to go.

### Make the right choice

It is all about making the right choice. Just specify your requirements regarding environment/corrosion class, load and support distances etc and you will have a customised selection for your

installation. Your calculations are saved, so you can adjust them at any time. The configuration tool is automatically updated as products are launched or replaced, enabling accurate and exact configurations. You can also easily have the BOM (Bill of Material) transferred to Excel to be used as your shopping list.

Today the configuration tool is available in English, Russian and Swedish and more versions are under development.

# The right surface treatment – crucial for a successful outcome

A cable support installation is considered to be a long-lasting solution and the life expectancy is dependent on the environment in which it is placed. A thorough investigation of the setting in terms of corrosion, pollution, humidity, salt, sanitary regulations etc will help you make the best choice. Our range of cable ladders and accessories covers all types of surface treatments, enabling a reliable, cost-efficient and long-lasting cable support solution.

The life expectancy of a cable support system is dependent on the environment in which it is placed. Therefore, it is important to establish the corrosive properties of an environment to ensure that the right treatment and the right material are chosen. The table below shows various corrosion classes. As a guide, we have included the surface treatment recommended by Schneider Electric for the different classes.

On the next page, we briefly outline the various surface treatments and materials. As regards environmental corrosion, a steel design component can usually be assigned to one of the corrosion classes (C1 to C5-M) as shown in table A. Reference values for the average level of corrosion in steel and zinc are given in table B. The corrosion classes comply with those stipulated in SS-EN ISO 12944-2.

**Table A**

Corrosion classes as stipulated by SS-EN ISO 12944-2 with atmospheric corrosion levels and examples of the environment in which they are most suitable for use.

Corrosion class	Environmental corrosion	Examples of typical environments in temperate climates (informative)		Schneider Electric designation
		Outdoors	Indoors	
C1	Very low	–	Heated areas with arid atmosphere and insignificant quantities of pollutant, e.g. offices, shops, schools and hotels.	Electro-galvanised DIN 50961/ISO 2081

**Electro-galvanised**

Products are manufactured in accordance with DIN 50961/ISO 2081. Such products are intended for use only in warm, dry areas with negligible pollutant levels.

**Pre-galvanised**

Products are manufactured from Z 275 pre-galvanised sheet steel in accordance with SS-EN 10327:2004. Under normal conditions, surface sections created during cutting and drilling will repair themselves, providing superb anti-corrosion protection.

**Hot-dip galvanised**

Schneider Electric has one of the most modern hot-dip galvanisation plants in the Nordic countries. The hot-dip process is continuous, guaranteeing a high and even quality. The manufactured products are hot-dip galvanised in accordance with EN-ISO 1461:2009 whilst nuts and bolts are hot-dip galvanised in accordance with SS-EN ISO 10684:2004. This form of galvanisation affords very good value-for-money anti-corrosion protection in atmospheres with a pH value of between 6 and 13. However, in acidic environments where pH levels fall below 6 and in alkaline environments where the pH value exceeds 13, the protective zinc layer breaks down relatively quickly.

**Zinc+**

Zinc+ surface treatment for some accessories (EN 10346) with a metallic Zinc-based coating containing aluminium and magnesium that offers ultimate corrosion resistance in aggressive environments (e.g. chloride & highly alkaline). In many cases a good alternative to hot-dip galvanisation. Excellent surface finish with self-repairing protection of cut edges (galvanic protection).

**Zinkpox®**

The Zinkpox® method involves applying a homogenous polyester coating to the zinc layer. Besides resisting light-initiated degeneration and weathering, this powder coating has excellent mechanical properties as regards impact resistance and adhesion. It is also resistant to most chemicals. Compared to hot-dip galvanising, applying a polyester coating to the zinc layer more than doubles the service life of treated components. The zinc layer prevents the development of filiform corrosion. This might otherwise degrade the coating. Consequently, the polyester coating is subject only to atmospheric attack and thus protects the zinc layer. The certified coating plant that treats our components uses a modern and environment-friendly process. Before powder coating, the galvanised components undergo meticulous pre-treatment. This ensures superb adhesion. In addition to extremely good corrosion protection, the Zinkpox® method also offers a choice of colours. Powder coating is a very environment-friendly way of achieving a coloured surface. Because the coating contains no solvents, it has largely replaced solventbased liquid coatings. Where installations are visible, cable ladders and fittings can be finished in a coating that matches the surrounding décor.

**Stainless steel**

Products manufactured in accordance with SS 2338/AISI 304 or SS 2348/AISI 316L are designed for use in highly aggressive environments, either indoors or outdoors, on industrial sites where there are high levels of potent airborne pollution such as in certain chemical industries, cellulose-related industries, refineries or artificial fertilizer factories, high humidity tunnels, etc. Stainless steel products are also ideal for use in environments where special hygiene requirements are in force, such as dairies, abattoirs, other food industries and pharmaceutical factories.

**Stainless steel AISI 304 or AISI 316L**

The deciding factor in choosing between stainless steel AISI 304 or AISI 316L is the aggressiveness of the environment in which it is to be used and for this atmospheric chlorine content plays a significant role. Environments with a high chlorine content, coastal areas being a prime example, are aggressive and usually require the use of AISI 316L materials. When assessing the needs of factories, consideration should be given to the materials previously used to suspend equipment such as pipe tubing and from this determine whether stainless steel AISI 304 or AISI 316L material is required.

**To consider when installing Stainless Steel Cable Ladders**

1. **Transport/handling:** Make sure that no iron objects come into contact with the stainless steel products.
2. **Storing:** Never store stainless steel products close to where iron products are machined, for example close to cutting and grinding operations
3. **Welding:** Welding during installation should be avoided where possible. If welding must be performed, make sure that only methods suitable for stainless steel are used.
4. **Tools:** When cutting or grinding, always use cutting wheels and grinding tools which are free from iron. Do not use tools that have been previously used for cutting or grinding products containing iron. When drilling, use an HSS-drill. To maximise the useful life of the drill, employ a cooling fluid during drilling. When installing, conventional assembly tools can be used. However, when using a nut tightener, ensure that the thread is first lubricated to prevent jamming.

**Never mix untreated or galvanised products with stainless steel.**

5. **Measures:** If a blue annealing appears when cutting, grinding or drilling, remove it with pickling paste, making sure that the paste is then carefully washed away with water. If selective corrosion appears it can be removed by:

- a) Washing away with water (high-pressure if possible).
- b) Polishing with a cleaning cloth or a fine emery paper (wet or dry) and washing with water.
- c) Grinding with a fine-grained wheel and washing with water.
- d) Pickling with pickling paste, making sure that the pickling paste is then carefully washed away with water.

6. When using pickling paste or similar products, always study the safety code for the product prior to use.

# Installation regulations

## Current load of cables

### Installation of cables on a cable ladder

The installation of cables on cable ladders lies within the IEC 60634 standard for power cable installation only. Because Wibe cable ladders have rungs which occupy less than 10% of the plan area under the cables, the installation is defined as cables in "free air". Cable spaces do not require any de-rating factor for installation. Cables touching must be de-rated in accordance with the table below.

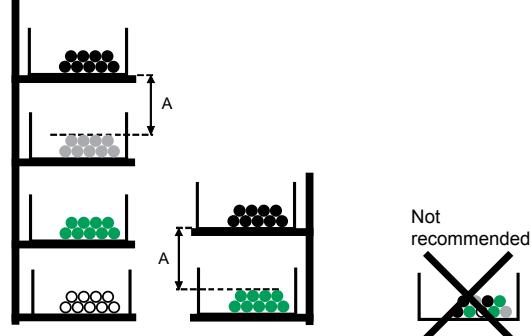

Method of installation	Correction Factor $C_g$ Number of circuits of multicore cables								
	2	3	4	5	6	7	8	9	
Single layer multicore touching on ladder supports	0,87	0,82	0,80	0,80	0,79	0,79	0,78	0,78	

For installation of a combination of power and communication cables on a cable ladder the separating distances should be according to EN 50174-2, see table below.

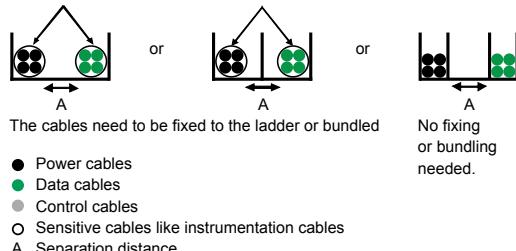

Communication cable type	Number of power circuits (1-phase 20A, 230V)									
	1-3	4-6	7-9	10-12	13-15	16-30	31-45	46-60	61-75	>75

#### Recommended cable management

#### Recommended cable management on common cable ladder

### Installation of cable ladder

Full design data is given according to EN 61537 in the Range part in this catalogue showing all maximum and recommended loadings. Graphs are given in this catalogue to show the deflection against loading for various support distances. Any support system which is supported at intervals and loaded will deflect between the support intervals. Test model II is used for all ladder ranges except the reinforced models which are tested according to Test model IV, longer than 4 metres spans.

### Installation recommendations for cable ladders

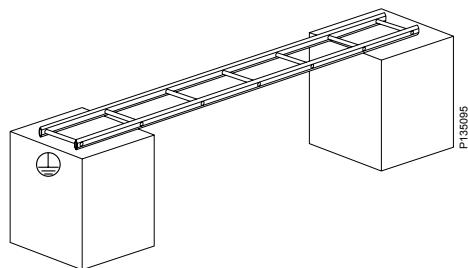

The cable ladders should be installed in such a way that, as often as possible, the cables can be laid directly in place rather than being pulled through. Ladders for current carrying cables along the ceiling should be installed in such a way that the distance from the top of the ladder to the ceiling is not less than 300 mm. The free vertical distance between parallel ladders shall be at least 200 mm. Ladders near walls should be installed with a minimum free distance of 50 mm to the wall, so that cables can pass between the ladders and the wall. Ladders along partition walls should be installed with a minimum free distance of 100 mm to the wall. Sharp edges and screw ends on ladders should be removed before the cables can be installed. Expansion bolts for the installation of brackets/fixings should be installed with such a distance between them, that the designated load for ladders will not be exceeded. When selecting the distance between cantilever arms or brackets/fixings, the bearing strength and designated load of the ladders must be taken into consideration.

## Electromagnetic Compatibility

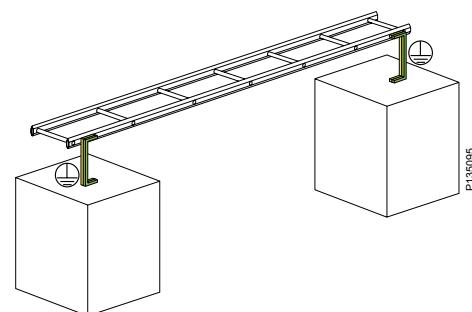

Schneider Electric has performed measurements at EMC Services in Gothenburg regarding EMC requirements, report RE-10273-17181. The results show that the shielding performance of both incoming and emitted fields is good concerning Wibe cable ladders.

When correctly installed Wibe cable ladders products work as a protective earth structure. This means that Schneider Electric products can be used to achieve good engineering practice in accordance with the EMC directive 2004/108/EG.

## Recommended installation examples

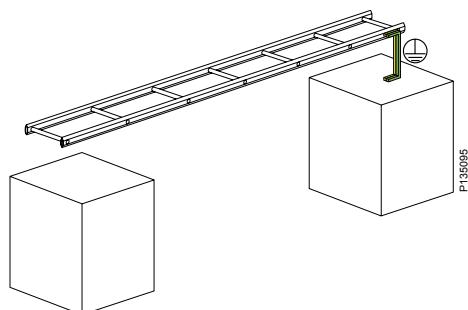

Metal against metal connection  
- the ultimate installation

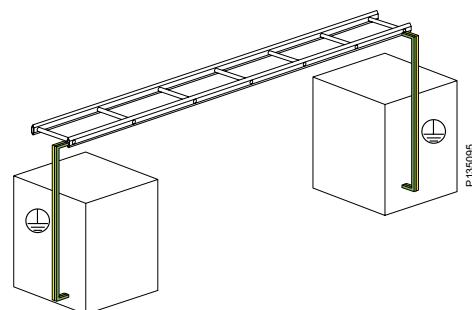

Short double connection  
- realistic installation

## Not recommended installation examples

Single connection  
- poor installation

Long double connection  
- in best case EMC neutral

**Electrical continuity and earthing**

The standard EN 61537 establishes that for cable ladders with electrical continuity characteristics (metal), this continuity should be guaranteed by means of an equipotential connection and one or several connections to earth in accordance with the use of the ladder system.

The impedance must not exceed:

- 50 mΩ through the joint.
- 5 mΩ x metre of cable ladders.(\*)

(\*) Currently this value is studied through document IEC/SC23A/WG12, CLC/TC213/WG-5 – 765. It will be changed to 50 mΩ x metre.

The metre length and joining systems for the different sections that Schneider Electric has, as well as the joints of the different accessories supplied, comply with

the electrical continuity test established in the aforementioned standard, guaranteeing the impedance established. To guarantee these impedance values tightening torque values of no less than 5 Nm are recommended, always using the joins recommended for each ladder type and taking sizes into account.

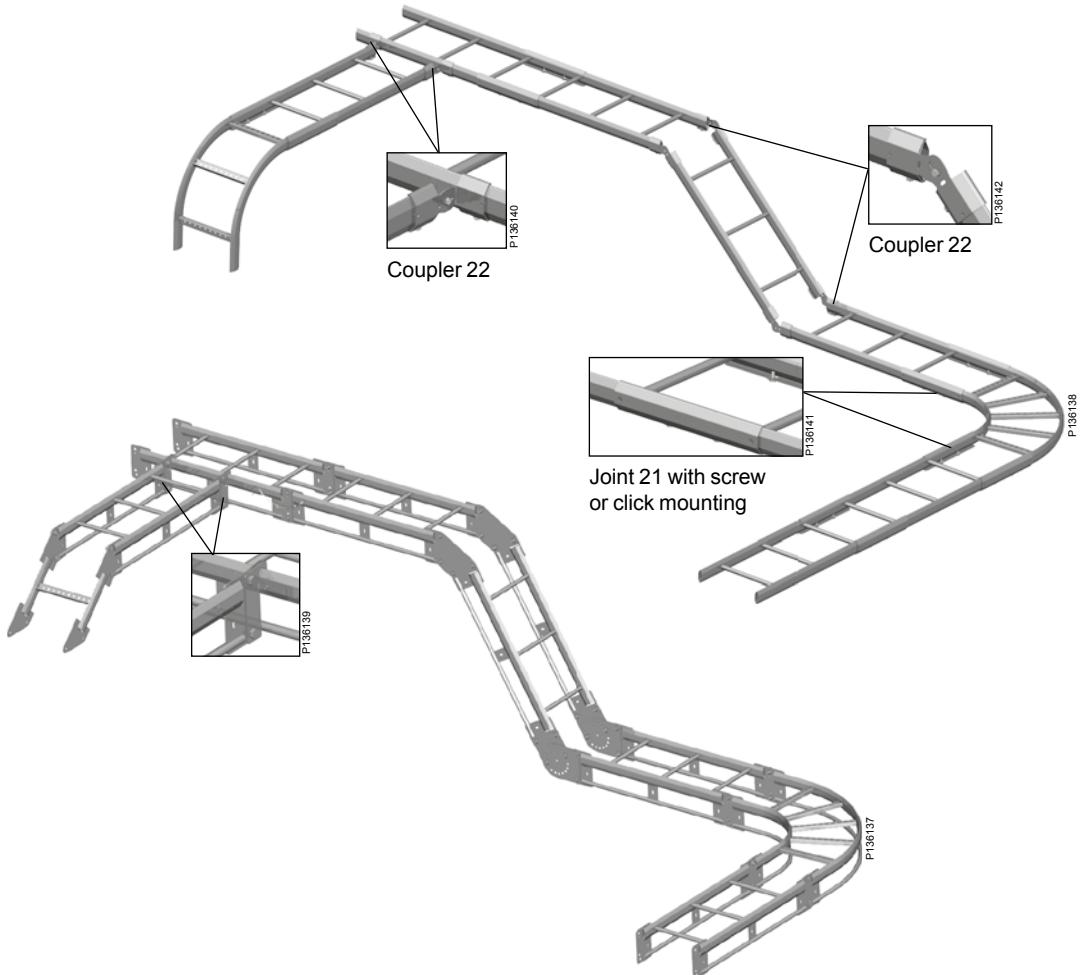

To guarantee a safe installation, Schneider Electric recommends a proper earthing of all the elements that make up the system (sections and accessories), using the accessories designed specifically for this purpose.

SCHNEIDER ELECTRIC RECOMMENDS NOT TO USE THE LADDER AS EARTH OR NEUTRAL CONDUCTORS. SCHNEIDER ELECTRIC IS NOT RESPONSIBLE OF ANY DAMAGE IF YOU USE ACCESSORIES FROM OTHER MANUFACTURERS.

### Joint 21, with screws or screwless

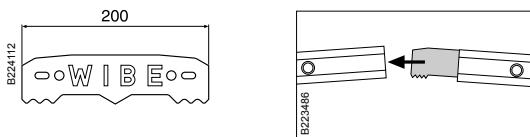

Joint to be used for straight, rigid joining of cable ladders, bends, junctions and risers. No extra earthing needed.

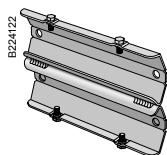

### Joint 9

Joint to be used for straight joining of cable ladders KHZ, KHZP and KHZPS. The teeth of the joint should face downwards. Under load, the ladders are prevented from slipping apart. If the joint is above a bracket, the teeth should face upwards.

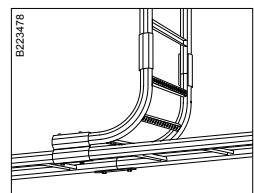

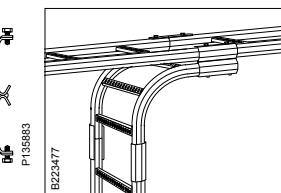

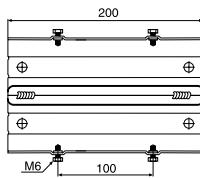

Joint 9 is used in straight joints of KHZ, KHZP and KHZPS.

### Dropper joint 32

Dropper joint used to form vertical branches in centre position under/on top of cable ladders.

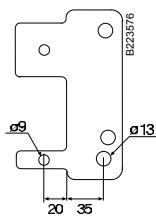

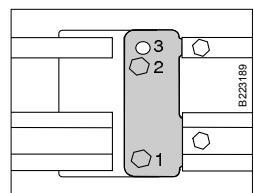

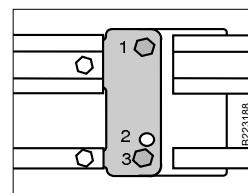

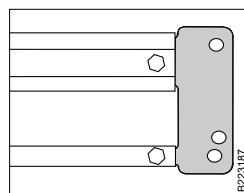

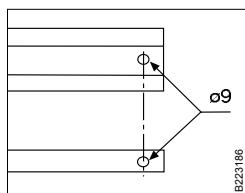

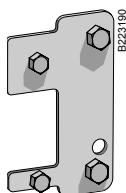

To be used together with Riser 18 to form vertical branches under Cable ladder KHZ, KHZP, KHZSP, KHZSPZ and KHZPS.

May also be used together with Riser 18 to form vertical branches on top of Cable ladder KHZ, KHZP, KHZSP, KHZSPZ and KHZPS.

### Joint 45

Joint to be fitted as a joining plate in a cut KHZV/KHZPV ladder.

Cable ladders can be joined using separate joints.

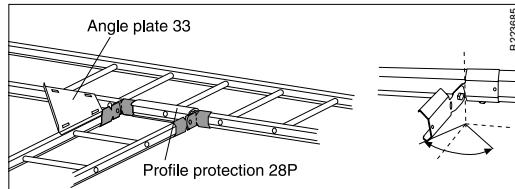

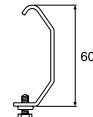

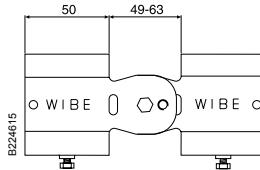

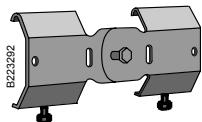

- Cut the ends clean.
- Place the joints outside the ladders and mark where the holes shall be drilled.
- Drill 9 mm dia. holes.

- Insert the joint plates into the ladders and bolt them fast.

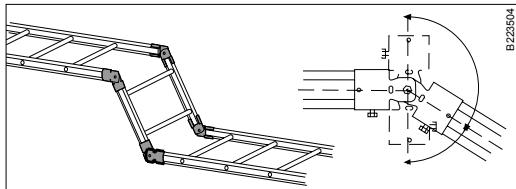

The holes are laterally displaced to avoid play in joints. If the ladders are mounted with arch pipes facing downwards, use holes 1 and 3.

If the ladders are mounted with arch pipes facing upwards, use holes 1 and 2.

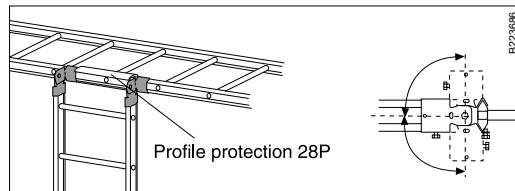

### Coupler 22

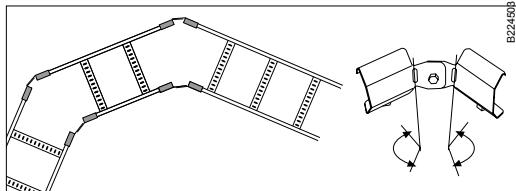

Coupler 22 is used for horizontal branching to the required angle. The cut length of the ladder ends determines the angle. Angle plate 33 is always recommended for horizontal branches. Use Profile protection 28P.

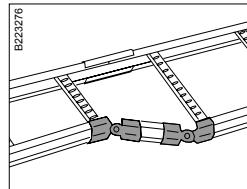

Coupler 22 is used to form vertical angles of the required size.

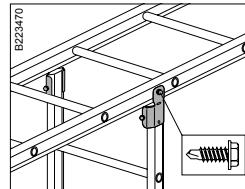

Coupler 22 is used to form vertical branches of the required angle. Mount Profile protection 28P. To be cut when required.

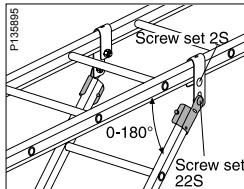

Use 4 Couplers 22 to form a horizontal bend in different angles. The cut lengths of the ladder ends determine the angle.

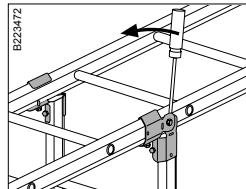

As an alternative at transition joining of KHZSP, KHZPS, KHZ and KHZP use 1 Joint 21 and 2 Couplers 22.

Vertical branching under the cable ladder with one part of Coupler 22 and plate screw.

Clamp 12 and one part of Coupler 22 can be used for branching under the cable ladder – allowing angles from 0 – 180°.

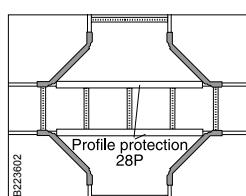

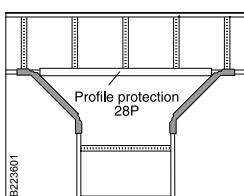

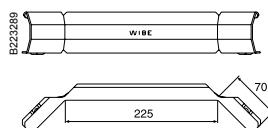

Use 2 Coupler 22 for vertical branching under the cable ladder. **Note!** The screw of Coupler 22 must be turned so that its head will be placed against the side profile of the cable ladder. Bend the coupler with a screwdriver.

### Junction coupler 14

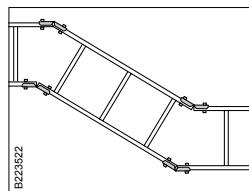

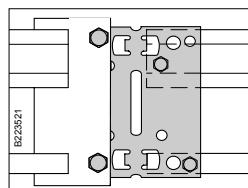

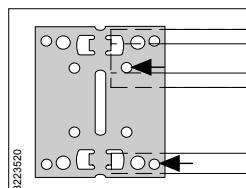

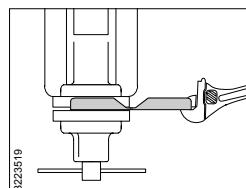

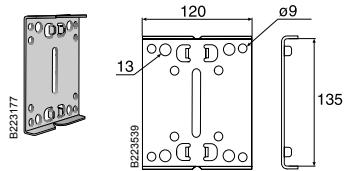

Junction coupler to be used for T- and X-junctions. Suitable for cable ladders KHZ, KHZP, KHZSP and KHZPS, all cable widths.

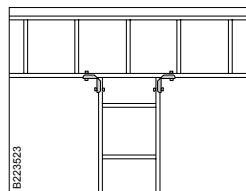

For T-junctions, use 2 Junction couplers 14. For X-junctions, use 4 Junction couplers 14. A bracket should be placed under the connecting ladder close to the connection. Profile protection 28P is recommended. To be cut to required length.

### Coupler 44

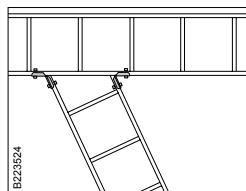

Coupler to be used for horizontal coupler of cable ladders KHZV/KHZPV. Also to be used for branches and as an end connection against a wall.

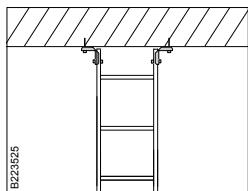

Angled cutting of the ladder ends determines the angle.

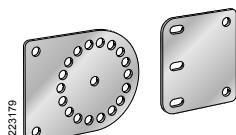

Straight branch.

Angled branch.

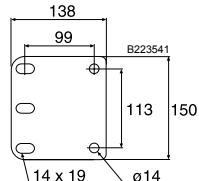

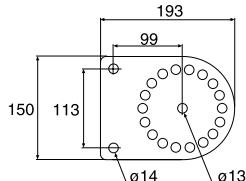

Use Coupler 44 as an end attachment for mounting ladders against walls or floors.

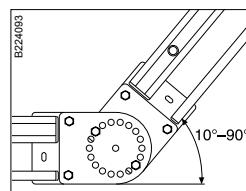

### Coupler 51

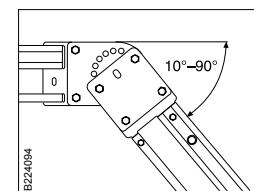

Coupler to be used as a self-supporting vertical coupler of cable ladders KHZV/KHZPV.

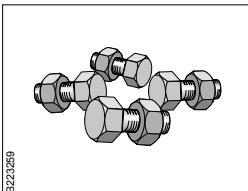

*Screw set M12 for installation on the cable ladder is to be ordered separately.*

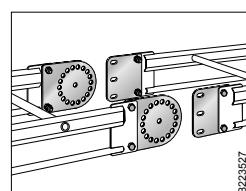

Rising. Adjustable from 10° to 90° gradually in steps of 20°.

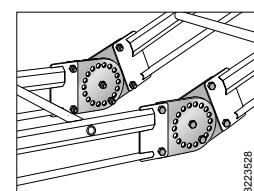

Sloping. Adjustable from 10° to 90° gradually in steps of 20°.

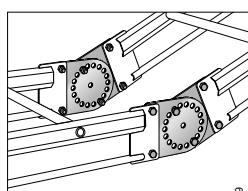

Screw set to be used for all joints with cable ladders KHZV and KHZPV.

1. Install the plates on the ladder with Screw set M12.

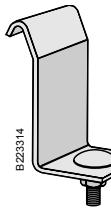

2. Assemble the ladders in the centre hole with one of the included screws/nuts. Adjust to desired angle and fix the installation in one of the outer holes with screw/nut.

3. Move the nut in the centre hole to the opposite outer hole and tighten.

## Use and installation

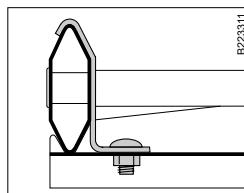

### Profile clamp 42

Profile clamp to be used for installations where the cable ladder is to be fixed to cantilever arms, support brackets, etc.

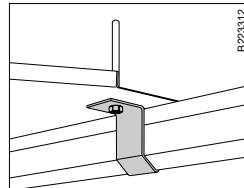

B223310

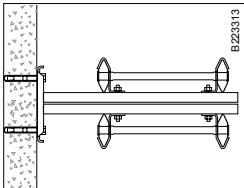

B223311

Use Profile clamp 42 for attaching KHZSP, KHZPS, KHZ and KHZP to Cantilever arm 50 and Support bracket 3. For small loads, mount the ladder with a clamp on each cantilever arm, alternately right side and left side.

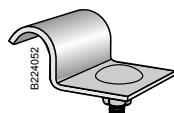

B223312

B223313

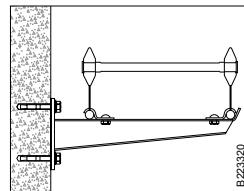

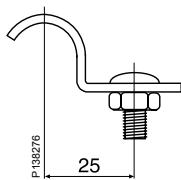

To lock Angle plate 33/2, fit 2 Profile clamp 42.

Cable ladders can be mounted directly on Vertical piece 20 or 20F with Profile clamp 42. Use T-bolt for mounting. Convenient at vertical installations in shafts.

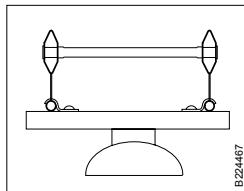

### Profile clamp 43

Profile clamp to be used for installations where the cable ladders KHZV and KHZPV are to be fixed to cantilever arms, support brackets, etc.

B223320

B224467

Use Profile clamp 43 to attach KHZV/KHZPV to Cantilever arm 50. For small loads, mount the ladder with a clamp on each cantilever arm, alternating right side and left side.

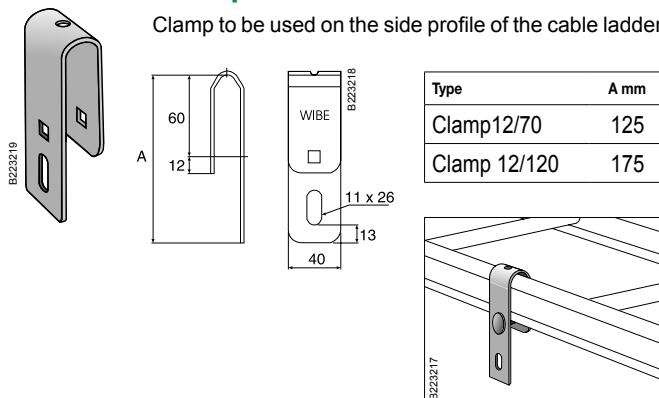

Pendant/Fixing rail 24/48, mounted under Cable ladder KHZV with Profile clamp 43, here used as carrier of lighting fittings.

# Technical information

## Use and installation

### Clamp 12

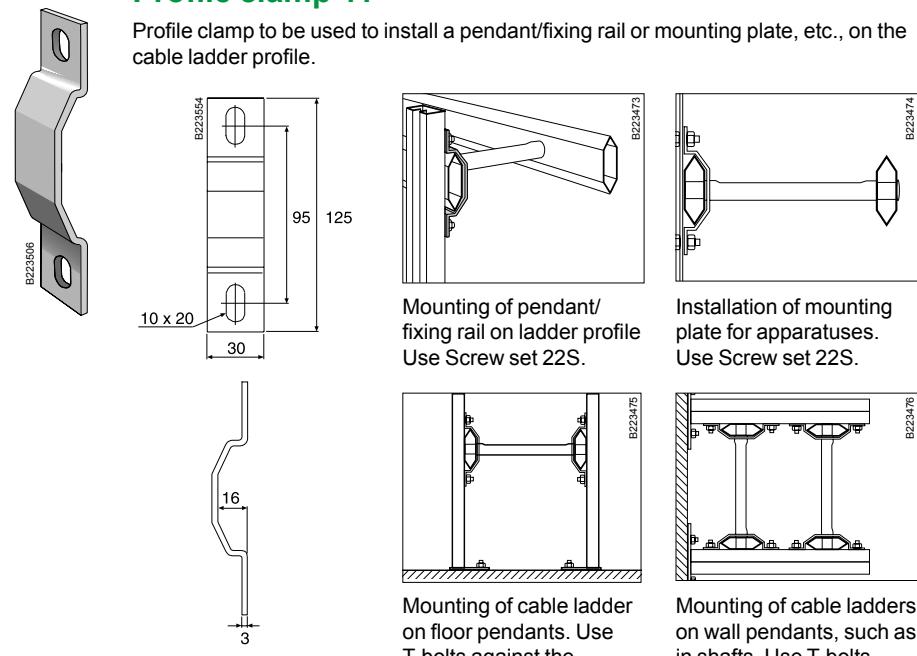

Clamp to be used on the side profile of the cable ladder for installation of accessories.

Clamp 12 can be used for installation of antenna brackets, junction boxes and so on. Use Screw set 2S for hot dip clamp or Screw set W37 or stainless steel clamp.

### Profile clamp 41

Profile clamp to be used to install a pendant/fixing rail or mounting plate, etc., on the cable ladder profile.

Mounting of pendant/fixing rail on ladder profile  
Use Screw set 22S.

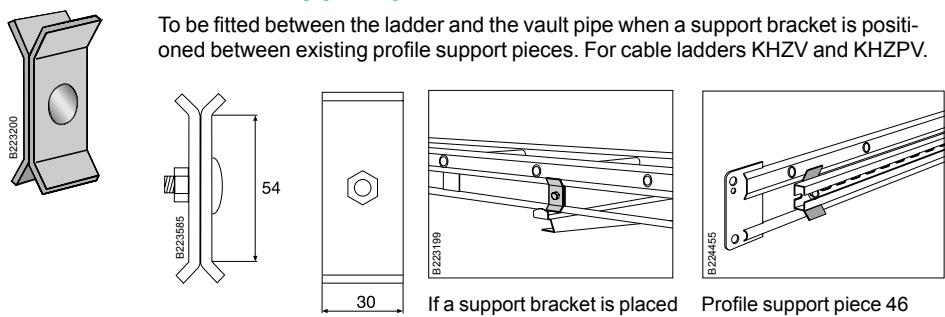

Installation of mounting plate for apparatuses.  
Use Screw set 22S.

Mounting of cable ladder on floor pendants. Use T-bolts against the opening of the fixing rail.

Mounting of cable ladders on wall pendants, such as in shafts. Use T-bolts against the openin of the fixing rail.

### Profile support piece 46

To be fitted between the ladder and the vault pipe when a support bracket is positioned between existing profile support pieces. For cable ladders KHZV and KHZPV.

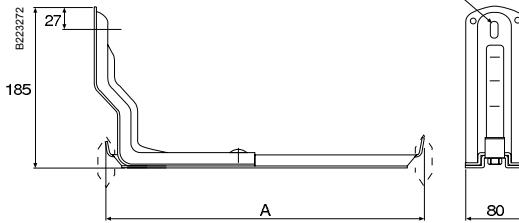

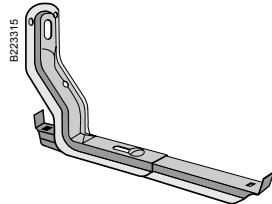

If a support bracket is placed between two profile support pieces, a Profile support piece 46 must be mounted between the arch pipes and the ladder. If the load is half the permitted load, exclude the Profile support piece 46.

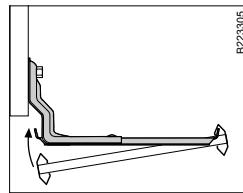

Profile support piece 46 can be installed as a fixing for different applications.

### Cantilever arm 30

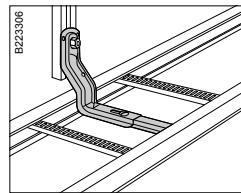

Cantilever arm for installation inside cable ladder KHZSP.

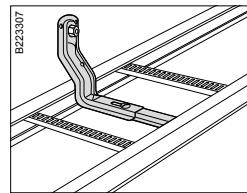

Cantilever arm type	A mm
30/200	184
30/300	284
30/400	384
30/500	484
30/600	584

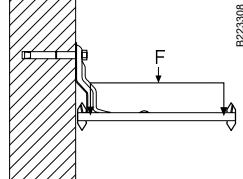

Installation of cable ladder KHZSP. Place the ladder on the outer tab and press it over the inner tab. When necessary, the ladder can be locked with a Profile clamp 43.
